

# Netkiller Virtualization 手札

陈景峰 著

kubernetes

# Netkiller Virtualization 手札

## 目录

### 自述

1. 写给读者
2. 作者简介
3. 如何获得文档
4. 打赏 (Donations)
5. 联系方式

### 1. Docker

#### 1. Installation

- 1.1. CentOS 8  
docker-compose
- 1.2. CentOS 6
- 1.3. CentOS 7 docker-ce
- 1.4. Ubuntu
- 1.5. Ubuntu docker-ce
- 1.6. 测试 Docker
- 1.7. 重置 Docker

#### 2. 配置 Docker

- 2.1. 开启远程访问
- 2.2. 镜像配置  
临时选择镜像  
切换国内镜像
- 2.3. ulimit 资源

#### 3. 镜像

- 3.1. 搜索镜像
- 3.2. 获取镜像
- 3.3. 列出本地镜像
- 3.4. tag
- 3.5. 保存和载入镜像
- 3.6. 删除本地镜像
- 3.7. history 镜像历史纪录

## 4. 容器

- 4.1. 查看容器
- 4.2. 启动与终止容器
- 4.3. 进入容器
- 4.4. 运行容器内的命令
- 4.5. 导出和导入容器
  - Ubuntu
  - Mac 导出与导入
- 4.6. 停止所有容器
  - 信号处理
- 4.7. 删除容器
- 4.8. log-driver
- 4.9. 操作系统
  - 设置环境变量
  - /etc/hosts 配置
  - sysctl
  - ulimits
- 4.10. 查看容器内运行的进程
- 4.11. 更新容器资源配置
- 4.12. 查看容器的退出状态
- 4.13. 暂停与恢复容器
- 4.14. 对比容器的变化
- 4.15. 查看容器状态
- 4.16. 重启容器

## 5. 卷管理

- 5.1. 列出卷
- 5.2. 创建卷
- 5.3. 挂在镜像
- 5.4. 检查卷
- 5.5. 删除卷
- 5.6. 销毁所有未使用的卷
- 5.7. 在多个容器间共享卷
- 5.8. 容器绑定本地文件系统
- 5.9. 只读权限

## 6. 仓库

- 6.1. Docker 官方仓库

- 登陆仓库
  - 获取镜像
  - 上传镜像
- 6.2. 私有仓库
  - 搭建私有仓库
  - 推送镜像到私有仓库
  - 查询镜像
  - registry 镜像高级配置
  - 私有仓库认证
  - registry 接口
- 6.3. Harbor
- 7. Swarms
  - 7.1. 管理 Swarms
    - 查看 Swarms 版本
    - 初始化 Swarms
    - 显示 join-token
    - 创建虚拟机
    - 显示虚拟机列表
    - 设置管理节点
    - 环境变量
    - 切换节点
    - 启动/停止节点
    - 离线
  - 7.2. Stack
  - 7.3. 服务
    - 创建 Service
    - 删除 Service
    - inspect
  - 7.4. Docker 网络
    - 创建 overlay 网络
  - 7.5. swarm 卷管理
    - Host Volumes
    - Named Volumes
    - 共享卷
- 8. docker 命令
  - 8.1. docker - A self-sufficient runtime for containers

查看 docker 信息

run

start / stop / restart

ps

kill 信号

top

inspect

    获取容器名称

    容器镜像名称

    获取容器主机名 Hostname

    查询 IP 地址

    容器日志

    获取 json 配置

    函数

    综合查询

images

    Getting a new image

logs

重置 Docker

仓库操作

    登陆

    注销

build

网络管理

事件信息

从 docker 中复制文件

## 8.2. docker-compose - Define and run multi-container applications with Docker.

安装 docker-compose

    使用 pip 安装

    OSCM 安装

查看版本号

快速入门

启动

停止

    停止

- 启动
- 查看进程
- 查看日志
- 执行命令
- 运行

## 9. 基于 Dockerfile 创建镜像

- 9.1. 创建 Dockerfile 文件
- 9.2. 创建镜像
- 9.3. 运行镜像
- 9.4. 测试 Nginx
- 9.5. 提交镜像
- 9.6. Dockerfile 语法
  - COPY
  - EXPOSE
  - ENTRYPOINT

## 10. docker-compose.yml 容器编排

- 10.1. 版本号
- 10.2. 镜像
- 10.3. 容器名称
- 10.4. 启动策略
- 10.5. 容器用户
- 10.6. 挂在卷
- 10.7. 映射端口的标签
- 10.8. 添加 hosts 文件
- 10.9. links
- 10.10. 服务依赖
- 10.11. working\_dir
- 10.12. 设置环境变量
- 10.13. 临时文件系统
- 10.14. 编译 Dockerfile
- 10.15. resources 硬件资源分配

## 11. Docker Example

- 11.1. registry
  - Auth + SSL
- 11.2. Example Java - Spring boot with Docker
  - 获取 CentOS 7 镜像

- 安装 openjdk
- Spring boot 包
- 启动 Spring boot 项目
- 基于 CentOS 7 制作 spring 镜像

### 11.3. Redis

- Docker 命令
  - 获取 Redis 镜像
  - 启动一个 Redis 实例
  - 进入 Redis
  - 启动一个 Redis 实例并映射 6379 端口
  - 维护容器
- Docker compose
- Docker Stack

### 11.4. Nginx

- nginx:latest
- 安装 Docker Nginx alpine
- 安装依赖工具
- 容器内优雅重启

### 11.5. MySQL

## 12. Docker FAQ

- 12.1. 检查 Docker 是否可用
- 12.2. Bitnami
- 12.3. 删除 <none> 镜像

## 2. Kubernetes

### 1. Minikube

- 1.1. CentOS 8 安装 minikube
  - CentOS
    - 无虚拟机
  - Mac OS
- 1.2. Quickstart
- 1.3. minikube 命令
  - 启动 minikube
    - 虚拟机驱动
    - 开启GPU
    - 日志输出级别
    - CPU 和 内存分配

- 指定 kubernetes 版本
- 配置启动项
- 指定 registry-mirror 镜像
- 指定下载镜像
- Enabling Unsafe Sysctls
- 使用 CRI-O 容易

- 停止 minikube
- Docker 环境变量
- SSH
- 缓存镜像
- 清理 minikube
- Kubernetes 控制面板
- service
- 查看日志
- 查看 Docker 环境变量
- profile
- addons
  - 查看所有插件
  - 启用 addons
  - 查看 addons 列表
  - 开启 registry 私有库
  - 启用 ingress
- SSH
- 查看IP地址
- 镜像管理

#### 1.4. FAQ

This computer doesn't have VT-X/AMD-v enabled.  
Enabling it in the BIOS is mandatory  
ERROR FileContent--proc-sys-net-bridge-bridge-  
nf-call-iptables

Taint (污点) 和 Toleration (容忍)

Taint (污点) 设置

Toleration (容忍) 调度

使用场景

3.6. expose

3.7. 服务管理

列出服务

查看服务详细信息

更新服务

- 删除服务
- clusterip
- externalname
- loadbalancer
- nodeport
- serviceaccount

### 3.8. 部署管理

- 删除 deployment

### 3.9. 资源管理

#### 3.10. 查看 pod 日志

#### 3.11. 执行 Shell

#### 3.12. edit

#### 3.13. rollout

#### 3.14. port-forward 端口映射

#### 3.15. secret 密钥管理

- Private Registry 用户认证
- 配置TLS SSL

### 3.16. ConfigMap

- 创建 Key-Value 配置项

- 从文件创建 ConfigMap

- 查看 ConfigMap

- 删除 ConfigMap

### 3.17. Job/CronJob

- CronJob

### 3.18. explain

- ingress

### 3.19. 操作系统

- sysctls

## 4. Rancher - Multi-Cluster Kubernetes Management

### 4.1. 安装

- Ubuntu

- SSL 证书

- 进入容器

- Rancher CLI
- rancher-compose

#### 4.2. 快速入门

- API

#### 4.3. Rancher CLI

- 登陆 Rancher

- 查看集群

- 查看节点

- catalog

- 查看设置

#### 4.4. Rancher Compose

- Rancher Compose 命令

- 操作演示

#### 4.5. Rancher Kubernetes Engine (RKE)

#### 4.6. Rancher CLI

#### 4.7. 调试

#### 4.8. FAQ

- [network] Host [rancher.netkiller.cn] is not able to connect to the following ports:  
[rancher.netkiller.cn:2379]. Please check network policies and firewall rules

### 5. Helm - The package manager for Kubernetes

#### 5.1. 安装 Helm

- Ubuntu

- Mac

#### 5.2. 快速开始

#### 5.3. Helm 命令

- 初始化 Helm

- 查看仓库列表

- 搜索

- 查看包信息

- 安装

- 列表

- 删除

- 升级

- 回滚

- 查看状态
- 5.4. elastic
- 5.5. Helm Faq
- 6. kubectl example
  - 6.1. 私有 registry
  - 6.2. mongodb
  - 6.3. tomcat
- 7. Kubectl YAML
  - 7.1. ServiceAccount
  - 7.2. 创建命名空间
  - 7.3. Pod
    - 指定主机名
    - 健康状态检查
    - securityContext
      - sysctls
      - runAsUser
      - security.alpha.kubernetes.io/sysctls
    - Taint (污点) 和 Toleration (容忍)
  - 7.4. Service
    - 创建服务
    - 查看服务
    - 设置外部IP
    - 绑定外部域名
    - nodePort
    - LoadBalancer
    - Example
  - 7.5. ConfigMap
    - Key-Value 配置
    - 环境变量
    - 配置文件
  - 7.6. Volume
    - local
    - 案例

## 7.7. Job

- 执行单词任务

- 计划任务

## 7.8. Ingress

- 端口

- URI 规则

- vhost 虚拟主机

- rewrite

- annotations 配置

  - HTTP 跳转到 HTTPS

  - server-snippet

- 金丝雀发布（灰度发布）

  - 准备服务

  - 方案一，权重分配

  - 通过HTTP头开启灰度发布

  - 通过 Cookie 开启

- 管理 Ingress

## 8. istio

- 8.1. 启动 istio

- 8.2. 禁用 istio

## 9. Kubeapps

## 3. Virtual Machine(虚拟机)

### 1. Kernel-based Virtual Machine(KVM)

- 1.1. kvm install usage yum

  - brctl / tuncctl

  - virt-install

- 1.2. Ubuntu

- 1.3. CentOS 6.2

- 1.4. Scientific Linux Virtualization

- 1.5. libvirt

  - virsh

  - console

  - dumpxml

- Virtual Machine Manager

- 1.6. FAQ

No hypervisor options were found for this connection

如何判断当前服务器是实体机还是虚拟机

## 2. Xen

2.1. install

2.2. Manager

## 3. OpenVZ

3.1. 安装OpenVZ

3.2. 使用OpenVZ & 建立VPS

安装操作系统模板

创建OpenVZ操作系统节点 (VPS)

3.3. 设置VPS参数

## 4. vagrant - Tool for building and distributing virtualized development environments

4.1. vagrant for windows

## 5. 虚拟机管理

5.1. Proxmox - Open-source virtualization management platform Proxmox VE

5.2. OpenStack

5.3. CloudStack

5.4. OpenNode

5.5. OpenNEbula

## 范例清单

2.1. minikube 操作演示

3.1. virsh

### 内容摘要

本文档讲述Linux系统涵盖了系统管理与配置包括：

#### 对初学Linux的爱好者忠告

玩Linux最忌reboot（重新启动）这是windows玩家坏习惯

Linux只要接上电源你就不要再想用reboot,shutdown,halt,poweroff命令,Linux系统和应用软件一般备有reload,reconfigure,restart/start/stop...不需要安装软件或配置服务器后使用reboot重新引导计算机

在Linux系统里SIGHUP信号被定义为刷新配置文件,有些程序没有提供reload参数,你可以给进程发送HUP信号,让它刷新配置文件,而不用restart.通过pkill,killall,kill 都可以发送HUP信号例如: `pkill -HUP httpd`

我的系列文档:

# 致读者

Netkiller 系列电子书始于 2000 年，风风雨雨走过20年，将在 2020 年终结，之后不在更新。作出这种决定原因 很多，例如现在的阅 读习惯已经转向短视频，我个人的时间，身体健康情况等等.....

感谢读者粉丝这20年的支持

虽然电子书不再更新，后面我还会活跃在[知乎社区](#)和微信公众号

# 自述

Netkiller 手札系列电子书 <http://www.netkiller.cn>

## Netkiller Virtualization 手札

陈景峰 著

知乎专栏 <https://www.zhihu.com/column/netkiller>

《Netkiller 系列 手札》是一套免费系列电子书，netkiller 是 nickname 从1999 开使用至今，“手札”是札记，手册的含义。

2003年之前我还是以文章形式在BBS上发表各类技术文章，后来发现文章不够系统，便尝试写长篇技术文章加上章节目录等等。随着内容增加，不断修订，开始发布第一版，第二版.....

IT知识变化非常快，而且具有时效性，这样发布非常混乱，经常有读者发现第一版例子已经过时，但他不知道我已经发布第二版。

我便有一种想法，始终维护一个文档，不断更新，使他保持较新的版本不过时。

第一部电子书是《PostgreSQL 实用实例参考》开始我使用 Microsoft Office Word 慢慢随着文档尺寸增加 word 开始表现出力不从心。

我看到PostgreSQL 中文手册使用SGML编写文档，便开始学习 Docbook SGML。使用Docbook写的第一部电子书是《Netkiller Postfix Integrated Solution》这是Netkiller 系列手札的原型。

至于“手札”一词的来历，是因为我爱好摄影，经常去一个台湾摄影网站，名字就叫“摄影家手札”。

由于硬盘损坏数据丢失 《Netkiller Postfix Integrated Solution》的 SGML文件已经不存在；Docbook SGML存在很多缺陷 UTF-8支持不好，转而使用Docbook XML。

目前技术书籍的价格一路飙升，动则¥ 80，¥ 100，少则¥ 50，¥ 60。技术书籍有时效性，随着技术的革新或淘汰，大批书籍成为废纸垃圾。并且这些书技术内容雷同，相互抄袭，质量越来越差，甚至里面给出的例子错误百出，只能购买影印版，或者翻译的版本。

在这种背景下我便萌生了自己写书的想法，资料主要来源是我的笔记与例子。我并不想出版，只为分享，所以我制作了基于CC License 发行的系列电子书。

本书注重例子，少理论（捞干货），只要你对着例子一步一步操作，就会成功，会让你有成就感并能坚持学下去，因为很多人遇到障碍就会放弃，其实我就是这种人，只要让他看到希望，就能坚持下去。

## 1. 写给读者

为什么写这篇文章

有很多想法,工作中也用不到所以未能实现,所以想写出来,和大家分享.有一点写一点,写得也不好,只要能看懂就行,就当学习笔记了.

开始零零碎碎写过一些文档,也向维基百科供过稿,但维基经常被ZF封锁,后来发现sf.net可以提供主机存放文档,便做了迁移.并开始了我的写作生涯.

这篇文档是作者20年来对工作的总结,是作者一点一滴的积累起来的,有些笔记已经丢失,所以并不完整.

因为工作太忙整理比较缓慢.目前的工作涉及面比较窄所以新文档比较少.

我现在花在技术上的时间越来越少,兴趣转向摄影,无线电.也想写写摄影方面的心得体会.

### 写作动力:

曾经在网上看到外国开源界对中国的评价,中国人对开源索取无度,但贡献却微乎其微.这句话一直记在我心中,发誓要为中国开源事业做我仅有的一点微薄贡献

另外写文档也是知识积累,还可以增加在圈内的影响力.

人跟动物的不同,就是人类可以把自己学习的经验教给下一代人.下一代在上一代的基础上再创新,不断积累才有今天.

所以我把自己的经验写出来,可以让经验传承

### 没有内容的章节:

目前我自己一人维护所有文档,写作时间有限,当我发现一个好主题就会加入到文档中,待我有时间再完善章节,所以你会发现很多章节是空无内容的.

文档目前几乎是流水帐式的写作,维护量很大,先将就着看吧.

我想到哪写到哪,你会发现文章没一个中心,今天这里写点,明天跳过本

章写其它的.

文中例子绝对多,对喜欢复制然后粘贴朋友很有用,不用动手写,也省时间.

理论的东西,网上大把,我这里就不写了,需要可以去网上查.

我爱写错别字,还有一些是打错的,如果发现请指正.

文中大部分试验是在Debian/Ubuntu/Redhat AS上完成.

## 写给读者

至读者:

我不知道什么时候,我不再更新文档或者退出IT行业去从事其他工作,我必须给这些文档找一个归宿,让他能持续更新下去。

我想捐赠给某些基金会继续运转,或者建立一个团队维护它。

我用了20年时间坚持不停地写作,持续更新,才有今天你看到的《Netkiller 手札》系列文档,在中国能坚持20年,同时没有任何收益的技术类文档,是非常不容易的。

有很多时候想放弃,看到外国读者的支持与国内社区的影响,我坚持了下来。

中国开源事业需要各位参与,不要成为局外人,不要让外国人说:中国对开源索取无度,贡献却微乎其微。

我们参与内核的开发还比较遥远,但是进个人能力,写一些文档还是可能的。

## 系列文档

下面是我多年积累下来的经验总结,整理成文档供大家参考:

## 2. 作者简介

陈景峯 ([ネウキム](#))

Nickname: netkiller | English name: Neo chen | Nippon name: ちんけいほう (音訳) | Korean name: 천징봉 | Thailand name: ภูมิภาพภูเขา | Vietnam: Trần Cảnh Phong

Callsign: [BG7NYT](#) | QTH: ZONE CQ24 ITU44 ShenZhen, China

程序猿，攻城狮，挨踢民工，Full Stack Developer, UNIX like Evangelist, 业余无线电爱好者（呼号：BG7NYT），户外运动，山地骑行以及摄影爱好者。

《Netkiller 系列 手札》的作者

### 成长阶段

1981年1月19日(庚申年腊月十四)出生于黑龙江省青冈县建设乡双富大队第一小队

1989年9岁随父母迁居至黑龙江省伊春市，悲剧的天朝教育，不知道那门子归定，转学必须降一级，我本应该上一年级，但体制让我上学前班，那年多都10岁了

1995年小学毕业，体制规定借读要交3000两银子(我曾想过不升初中)，亲戚单位分楼告别平房，楼里没有地方放东西，把2麻袋书送给我，无意中发现一本电脑书BASIC语言，我竟然看懂了，对于电脑知识追求一发而不可收，后面顶零花钱，压岁钱主要用来买电脑书《MSDOS 6.22》《新编Unix实用大全》《跟我学Foxbase》。。。。。。

1996年第一次接触UNIX操作系统，BSD UNIX, Microsoft Xinux(盖茨亲自写的微软Unix，知道的人不多)

1997年自学Turbo C语言，苦于没有电脑，后来学校建了微机室才第一次使用QBASIC(DOS 6.22 自带命令)，那个年代只能通过软盘拷贝转播，Turbo C编译器始终没有搞到，

1997年第一次上Internet网速只有9600Bps, 当时全国兴起各种信息港域名格式是www.xxxx.info.net, 访问的第一个网站是NASA下载了很多火星探路者拍回的照片，还有“淞沪”sohu的前身

1998~2000年在哈尔滨学习计算机，充足的上机时间，但老师让我们练打字（明伦五笔/WT）打字不超过80个/每分钟还要强化训练，不过这个给我的键盘功夫打了好底。

1999年学校的电脑终于安装了光驱，在一张工具盘上终于找到了Turbo C, Borland C++与Quick Basic编译器，当时对VGA图形编程非常感兴趣，通过INT33中断控制鼠标，使用绘图函数模仿windows界面。还有操作UCDOS中文字库，绘制矢量与点阵字体。

2000年沉迷于Windows NT与Back Office各种技术，神马主域控制器，DHCP，WINS，IIS，域名服务器，Exchange邮件服务器，MS Proxy, NetMeeting...以及ASP+MS SQL开发；用56K猫下载了一张LINUX。ISO镜像，安装后我兴奋的24小时没有睡觉。

## 职业生涯

2001年来深圳进城打工,成为一名外来务工者. 在一个4人公司做PHP开发，当时PHP的版本是2.0, 开始使用Linux Redhat 6.2.当时很多门户网站都是用FreeBSD,但很难搞到安装盘，在网易社区认识了一个网友,从广州给我寄了一张光盘，FreeBSD 3.2

2002年我发现不能埋头苦干,还要学会"做人".后辗转广州工作了半年，考了一个Cisco CCNA认证。回到深圳重新开始，在车公庙找到一家工作做Java开发

2003年这年最惨,公司拖欠工资16000元,打过两次官司2005才付清.

2004 年开始加入[分布式计算](#)团队,[目前成绩](#)，工作仍然是Java开发并且开始使用PostgreSQL数据库。

2004-10月开始玩户外和摄影

2005-6月成为中国无线电运动协会会员,呼号BG7NYT,进了一部Yaesu FT-60R手台。公司的需要转回PHP与MySQL，相隔几年发现PHP进步很大。在前台展现方面无人能敌，于是便前台使用PHP，后台采用Java开发。

2006 年单身生活了这么多年,终于找到归宿. 工作更多是研究PHP各种框架原理

2007 物价上涨,金融危机，休息了4个月（其实是找不到工作），关外很难上439.460中继，搞了一台Yaesu FT-7800.

2008 终于找到英文学习方法， 《Netkiller Developer 手札》，《Netkiller Document 手札》

2008-8-8 08:08:08 结婚,后全家迁居湖南省常德市

2009 《Netkiller Database 手札》,2009-6-13学车，年底拿到C1驾照

2010 对电子打击乐产生兴趣，计划学习爵士鼓。由于我对Linux热爱，我轻松的接管了公司的运维部，然后开发运维两把抓。我印象最深刻的是公司一次上架10个机柜，我们用买服务器纸箱的钱改善伙食。我将40多台服务器安装BOINC做压力测试，获得了中国第二的名次。

2011 平凡的一年，户外运动停止，电台很少开，中继很少上，摄影主要是拍女儿与家人，年末买了一辆山地车

2012 对油笔画产生了兴趣，活动基本是骑行银湖山绿道，

2013 开始学习民谣吉他，同时对电吉他也极有兴趣；最终都放弃了。这一年深圳开始推数字中继2013-7-6日入手Motorola

MOTOTRBO XIR P8668, Netkiller 系列手札从Sourceforge向Github迁移; 年底对MYSQL UDF, Engine与PHP扩展开发产生很浓的兴趣, 拾起遗忘10+年的C, 写了几个mysql扩展(图片处理, fifo管道与ZeroMQ), 10月份入Toyota Rezi 2.5V并写了一篇《攻城狮的苦逼选车经历》

2014-9-8 在淘宝上买了一架电钢琴 Casio Privia PX-5S pro 开始陪女儿学习钢琴, 由于这家钢琴是合成器电钢, 里面有打击乐, 我有对键盘鼓产生了兴趣。

2014-10-2号罗浮山两日游, 对中国道教文化与音乐产生了兴趣, 10月5号用了半天时间学会了简谱。10月8号入Canon 5D Mark III + Canon Speedlite 600EX-RT香港过关被查。

2014-12-20号对乐谱制作产生兴趣  
(<https://github.com/SheetMusic/Piano>), 给女儿做了几首钢琴伴奏曲, MuseScore制谱然后生成MIDI与WAV文件。

2015-09-01 晚饭后拿起爵士鼓基础教程尝试在Casio Privia PX-5S pro演练, 经过反复琢磨加上之前学钢琴的乐理知识, 终于在02号晚上, 打出了简单的基本节奏, 迈出了第一步。

2016 对弓箭(复合弓)产生兴趣, 无奈天朝法律法规不让玩。每周游泳轻松1500米无压力, 年底入 xbox one s 和 Yaesu FT-2DR, 同时开始关注功放音响这块

2017 7月9号入 Yamaha RX-V581 功放一台, 连接Xbox打游戏爽翻了, 入Kindle电子书, 计划学习蝶泳, 果断放弃运维和开发知识体系转攻区块链。

2018 从溪山美地搬到半岛城邦, 丢弃了多年攒下的家底。11月开始玩 MMDVM, 使用 Yaesu FT-7800 发射, 连接MMDVM中继板, 树莓派, 覆盖深圳湾, 散步骑车通联两不误。

2019 卖了常德的房子, 住了5次院, 哮喘反复发作, 决定停止电子书更新, 兴趣转到知乎, B站

2020 准备找工作

职业生涯路上继续打怪升级

### 3. 如何获得文档

下载 Netkiller 手札 (epub,kindle,htm,pdf)

EPUB <https://github.com/netkiller/netkiller.github.io/tree/master/download/epub>

MOBI <https://github.com/netkiller/netkiller.github.io/tree/master/download/mobi>

PDF <https://github.com/netkiller/netkiller.github.io/tree/master/download/pdf>

CHM <https://github.com/netkiller/netkiller.github.io/tree/master/download/chm>

通过 GIT 镜像整个网站

<https://github.com/netkiller/netkiller.github.com.git>

```
$ git clone https://github.com/netkiller/netkiller.github.com.git
```

镜像下载

整站下载

```
wget -m http://www.netkiller.cn/index.html
```

指定下载

```
wget -m wget -m http://www.netkiller.cn/linux/index.html
```

**Yum** 下载文档

获得光盘介质，RPM包，DEB包，如有特别需要，请联系我

YUM 在线安装电子书

<http://netkiller.sourceforge.net/pub/repo/>

```
# cat >> /etc/yum.repos.d/netkiller.repo <<EOF
[netkiller]
```

```
name=Netkiller Free Books
baseurl=http://netkiller.sourceforge.net/pub/repo/
enabled=1
gpgcheck=0
gpgkey=
EOF
```

## 查找包

```
# yum search netkiller

netkiller-centos.x86_64 : Netkiller centos Cookbook
netkiller-cryptography.x86_64 : Netkiller cryptography Cookbook
netkiller-docbook.x86_64 : Netkiller docbook Cookbook
netkiller-linux.x86_64 : Netkiller linux Cookbook
netkiller-mysql.x86_64 : Netkiller mysql Cookbook
netkiller-php.x86_64 : Netkiller php Cookbook
netkiller-postgresql.x86_64 : Netkiller postgresql Cookbook
netkiller-python.x86_64 : Netkiller python Cookbook
netkiller-version.x86_64 : Netkiller version Cookbook
```

## 安装包

```
yum install netkiller-docbook
```

## 4. 打赏 (Donations)

If you like this documents, please make a donation to support the authors' efforts. Thank you!

# 第 1 章 Docker

<https://www.docker.com>

## 1. Installation

### 1.1. CentOS 8

下载 containerd.io

[https://download.docker.com/linux/centos/7/x86\\_64/stable/Packages/](https://download.docker.com/linux/centos/7/x86_64/stable/Packages/)

```
[root@localhost ~]# dnf install  
https://download.docker.com/linux/centos/7/x86_64/stable/Packages/  
containerd.io-1.2.13-3.2.el7.x86_64.rpm
```

安装 Docker

```
[root@localhost ~]# dnf config-manager --add-  
repo=https://download.docker.com/linux/centos/docker-ce.repo  
Adding repo from:  
https://download.docker.com/linux/centos/docker-ce.repo  
  
[root@localhost ~]# dnf install -y docker-ce  
  
[root@localhost ~]# systemctl enable docker  
[root@localhost ~]# systemctl start docker
```

```
[root@localhost ~]# docker -v
```

```
Docker version 19.03.12, build 48a66213fe
```

## **docker-compose**

<https://docs.docker.com/compose/install/>

```
curl -sL  
"https://github.com/docker/compose/releases/download/1.27.4/doc  
ker-compose-$(uname -s)-$(uname -m)" -o /usr/local/bin/docker-  
compose  
chmod +x /usr/local/bin/docker-compose
```

## **1.2. CentOS 6**

```
yum install docker-io  
service docker start  
chkconfig docker on  
docker pull centos:latest  
docker images centos
```

test

```
docker run -i -t centos /bin/bash
```

## **1.3. CentOS 7 docker-ce**

从官方网站获得最新社区版

```
yum install -y yum-utils
yum-config-manager --add-repo
https://download.docker.com/linux/centos/docker-ce.repo
yum makecache fast
yum -y install docker-ce

systemctl start docker
```

测试安装是否成功

```
docker run hello-world
```

## 1.4. Ubuntu

Ubuntu 默认版本

```
$ sudo apt update
$ sudo apt install docker.io
$ sudo ln -sf /usr/bin/docker.io /usr/local/bin/docker
$ sudo sed -i '$acomplete -F _docker docker'
/etc/bash_completion.d/docker.io
```

```
$ sudo docker run -i -t ubuntu /bin/bash
```

## 1.5. Ubuntu docker-ce

## 从官方网站获得最新社区版

```
#!/bin/bash

sudo apt remove docker docker-engine

sudo apt install \
    apt-transport-https \
    ca-certificates \
    curl \
    software-properties-common

curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo
apt-key add -
sudo apt-key fingerprint 0EBFCD88

sudo add-apt-repository \
    "deb [arch=amd64] https://download.docker.com/linux/ubuntu \
    $(lsb_release -cs) \
    stable"

sudo apt update
sudo apt install docker-ce

apt-cache madison docker-ce
```

## 启动参数配置 /etc/default/docker

```
neo@ubuntu:~$ cat /etc/default/docker
# Docker Upstart and SysVinit configuration file

#
# THIS FILE DOES NOT APPLY TO SYSTEMD
#
# Please see the documentation for "systemd drop-ins":
# https://docs.docker.com/engine/admin/systemd/
#
```

```
# Customize location of Docker binary (especially for
development testing).
#DOCKERD="/usr/local/bin/dockerd"

# Use DOCKER_OPTS to modify the daemon startup options.
#DOCKER_OPTS="--dns 8.8.8.8 --dns 8.8.4.4"

# If you need Docker to use an HTTP proxy, it can also be
specified here.
#export http_proxy="http://127.0.0.1:3128/"

# This is also a handy place to tweak where Docker's temporary
files go.
#export DOCKER_TMPDIR="/mnt/bigdrive/docker-tmp"
```

## 启动脚本 /etc/init/docker.conf

```
neo@ubuntu:~$ sudo cat /etc/init/docker.conf
[sudo] password for neo:
description "Docker daemon"

start on (filesystem and net-device-up IFACE!=lo)
stop on runlevel [! 2345]

limit nofile 524288 1048576

# Having non-zero limits causes performance problems due to
accounting overhead
# in the kernel. We recommend using cgroups to do container-
local accounting.
limit nproc unlimited unlimited

respawn

kill timeout 20

pre-start script
    # see also https://github.com/tianon/cgroupfs-
mount/blob/master/cgroupfs-mount
    if grep -v '^#' /etc/fstab | grep -q cgroup \
```

```

        || [ ! -e /proc/cgroups ] \
        || [ ! -d /sys/fs/cgroup ]; then
        exit 0

    fi
    if ! mountpoint -q /sys/fs/cgroup; then
        mount -t tmpfs -o uid=0,gid=0,mode=0755 cgroup
/sys/fs/cgroup
    fi
    (
        cd /sys/fs/cgroup
        for sys in $(awk '!/^#/ { if ($4 == 1) print $1
}' /proc/cgroups); do
            mkdir -p $sys
            if ! mountpoint -q $sys; then
                if ! mount -n -t cgroup -o $sys
cgroup $sys; then
                    rmdir $sys || true
                fi
            fi
        done
    )
end script

script
    # modify these in /etc/default/$UPSTART_JOB
(/etc/default/docker)
    DOCKERD=/usr/bin/dockerd
    DOCKER_OPTS=
    if [ -f /etc/default/$UPSTART_JOB ]; then
        . /etc/default/$UPSTART_JOB
    fi
    exec "$DOCKERD" $DOCKER_OPTS --raw-logs
end script

# Don't emit "started" event until docker.sock is ready.
# See https://github.com/docker/docker/issues/6647
post-start script
    DOCKER_OPTS=
    DOCKER_SOCKET=
    if [ -f /etc/default/$UPSTART_JOB ]; then
        . /etc/default/$UPSTART_JOB
    fi

    if ! printf "%s" "$DOCKER_OPTS" | grep -qE -e '-H|--
host'; then

```

```

        DOCKER_SOCKET=/var/run/docker.sock
    else
        DOCKER_SOCKET=$(printf "%s" "$DOCKER_OPTS" |
grep -oP -e '(-H|--host)\W*unix:\/\/\K(\S+)' | sed 1q)
    fi

    if [ -n "$DOCKER_SOCKET" ]; then
        while ! [ -e "$DOCKER_SOCKET" ]; do
            initctl status $UPSTART_JOB | grep -qE
"(stop|respawn)/" && exit 1
            echo "Waiting for $DOCKER_SOCKET"
            sleep 0.1
        done
        echo "$DOCKER_SOCKET is up"
    fi
end script

```

## 1.6. 测试 Docker

```

neo@MacBook-Pro ~ % docker run hello-world
Unable to find image 'hello-world:latest' locally
latest: Pulling from library/hello-world
1b930d010525: Pull complete
Digest:
sha256:2557e3c07ed1e38f26e389462d03ed943586f744621577a99efb7732
4b0fe535
Status: Downloaded newer image for hello-world:latest

Hello from Docker!
This message shows that your installation appears to be working
correctly.

To generate this message, Docker took the following steps:
 1. The Docker client contacted the Docker daemon.
 2. The Docker daemon pulled the "hello-world" image from the
Docker Hub.
    (amd64)
 3. The Docker daemon created a new container from that image
which runs the

```

executable that produces the output you are currently reading.

4. The Docker daemon streamed that output to the Docker client, which sent it to your terminal.

To try something more ambitious, you can run an Ubuntu container with:

```
$ docker run -it ubuntu bash
```

Share images, automate workflows, and more with a free Docker ID:

<https://hub.docker.com/>

For more examples and ideas, visit:

<https://docs.docker.com/get-started/>

```
neo@MacBook-Pro ~ % docker image ls
```

| REPOSITORY   |              | TAG    |
|--------------|--------------|--------|
| IMAGE ID     | CREATED      | SIZE   |
| hello-world  |              | latest |
| fce289e99eb9 | 2 months ago | 1.84kB |

```
neo@MacBook-Pro ~ % docker container ls --all
```

| CONTAINER ID       | IMAGE                         | COMMAND  | PORTS |
|--------------------|-------------------------------|----------|-------|
| CREATED            | STATUS                        |          |       |
| NAMES              |                               |          |       |
| ea694b443e9e       | hello-world                   | "/hello" |       |
| About a minute ago | Exited (0) About a minute ago |          |       |
| dreamy_feistel     |                               |          |       |

## 1.7. 重置 Docker

```
docker stop $(docker ps -a -q)
docker rm -f $(docker ps -a -q)
docker rmi -f $(docker images -q)
docker volume rm $(docker volume ls -q)
```

## 2. 配置 Docker

### 2.1. 开启远程访问

修改/etc/sysconfig/docker文件，在最后增加一行DOCKER\_OPTS

vim /etc/sysconfig/docker

```
DOCKER_OPTS="-H unix:///var/run/docker.sock -H tcp://0.0.0.0:2375"
```

修改/usr/lib/systemd/system/docker.service 在[Service]的ExecStart=下面增加一行\$DOCKER\_OPTS

```
[Unit]
Description=Docker Application Container Engine
Documentation=https://docs.docker.com
BindsTo=containerd.service
After=network-online.target firewalld.service
Wants=network-online.target
Requires=docker.socket

[Service]
Type=notify
# the default is not to use systemd for cgroups because the delegate issues
still
# exists and systemd currently does not support the cgroup feature set required
# for containers run by docker
EnvironmentFile=-/etc/sysconfig/docker
ExecStart=/usr/bin/dockerd $DOCKER_OPTS
ExecReload=/bin/kill -s HUP $MAINPID
TimeoutSec=0
RestartSec=2
Restart=always

# Note that StartLimit* options were moved from "Service" to "Unit" in systemd
229.
# Both the old, and new location are accepted by systemd 229 and up, so using
the old location
# to make them work for either version of systemd.
StartLimitBurst=3

# Note that StartLimitInterval was renamed to StartLimitIntervalSec in systemd
230.
# Both the old, and new name are accepted by systemd 230 and up, so using the
old name to make
# this option work for either version of systemd.
```

```

StartLimitInterval=60s

# Having non-zero Limit*s causes performance problems due to accounting overhead
# in the kernel. We recommend using cgroups to do container-local accounting.
LimitNOFILE=infinity
LimitNPROC=infinity
LimitCORE=infinity

# Comment TasksMax if your systemd version does not supports it.
# Only systemd 226 and above support this option.
TasksMax=infinity

# set delegate yes so that systemd does not reset the cgroups of docker
containers
Delegate=yes

# kill only the docker process, not all processes in the cgroup
KillMode=process

[Install]
WantedBy=multi-user.target

```

## 重启 docker

```

[root@localhost ~]# systemctl daemon-reload
[root@localhost ~]# systemctl restart docker

```

## 查看端口

```

[root@localhost ~]# ss -ltn | grep 2375
LISTEN      0          1024          :::2375          :::*

```

## 检查 docker 信息

```

[root@localhost ~]# curl -s http://localhost:2375/info
{"ID":"YNK5:OJTT:FELN:H4DQ:AG7H:W3RE:WGLD:TOOI:32CH:S6HR:AJ45:4VLZ","Containers":4,"ContainersRunning":0,"ContainersPaused":0,"ContainersStopped":4,"Images":10,"Driver":"btrfs","DriverStatus":[{"Build Version","Btrfs v4.9.1"},{"Library Version","102"}],"SystemStatus":null,"Plugins":{"Volume":["local"],"Network":["bridge","host","macvlan","null","overlay"],"Authorization":null,"Log":["awslogs","fluentd","gcplogs","gelf","journald","json-file","local","logentries","splunk","syslog"]},"MemoryLimit":true,"SwapLimit":true,"KernelMemory":true,"CpuCfsPeriod":true,"CpuCfsQuota":true,"CPUShares":true,"

bridge-nf-call-ip6tables is disabled"]}

```

## 2.2. 镜像配置

### 临时选择镜像

您可以在 Docker 守护进程启动时传入 `--registry-mirror` 参数：

```
$ docker --registry-mirror=https://registry.docker-cn.com daemon
```

### 切换国内镜像

设置默认镜像，修改 `/etc/docker/daemon.json` 文件，并添加上 `registry-mirrors` 键值。

Docker 中国官方镜像

```
{
  "registry-mirrors": ["https://registry.docker-cn.com"]
}
```

设置多个镜像

```
{
  "registry-mirrors": [
    "https://registry.docker-cn.com",
    "http://hub-mirror.c.163.com",
    "https://docker.mirrors.ustc.edu.cn"
  ]
}
```

```
"registry-mirrors": ["https://mirror.ccs.tencentyun.com"]
```

## 2.3. ulimit 资源

/etc/docker/daemon.json

```
"default-ulimits": { "nofile": { "Name": "nofile", "Hard": 128000, "Soft":
128000 } }
```

## 3. 镜像

Docker 镜像地址 <https://registry.hub.docker.com/>

### 3.1. 搜索镜像

```
$ sudo docker search centos | more
```

| NAME                          | STARS | OFFICIAL | AUTOMATED | DESCRIPTION                      |
|-------------------------------|-------|----------|-----------|----------------------------------|
| centos                        | 542   | [OK]     |           | The official build of CentOS.    |
| tianon/centos                 |       |          |           | CentOS 5 and 6, created using    |
| rinse instea...               | 28    |          |           |                                  |
| ansible/centos7-ansible       | 13    |          | [OK]      | Ansible on Centos7               |
| saltstack/centos-6-minimal    | 7     |          | [OK]      |                                  |
| blalor/centos                 | 7     |          | [OK]      | Bare-bones base CentOS 6.5 image |
| steef/graphite-centos         |       |          |           | CentOS 6.x with Graphite and     |
| Carbon via ng...              | 6     |          | [OK]      |                                  |
| ariya/centos6-teamcity-server | 6     |          | [OK]      | TeamCity Server 8.1 on CentOS 6  |
| tutum/centos                  |       |          |           | Centos image with SSH access.    |
| For the root...               | 5     |          | [OK]      |                                  |
| tutum/centos-6.4              |       |          |           | DEPRECATED. Use tutum/centos:6.4 |
| instead. ...                  | 5     |          | [OK]      |                                  |

### 3.2. 获取镜像

可以使用 `docker pull` 命令来从官网仓库获取所需要的镜像。

```
$ sudo docker pull ubuntu:14.04
```

等同于

```
$ sudo docker pull registry.hub.docker.com/ubuntu:14.04
```

## 获得所有版本镜像

```
$ sudo docker pull ubuntu

$ sudo docker images
```

| REPOSITORY | TAG     | IMAGE ID     | CREATED      |
|------------|---------|--------------|--------------|
| ubuntu     | utopic  | 277eb4304907 | 3 days ago   |
| 215.6 MB   |         |              |              |

| 183 MB     |         |              |              |
| ubuntu     | lucid   | 3db9c44f4520 | 6 months ago |
| 183 MB     |         |              |              |

## 从其他服务器获得镜像

```
$ sudo docker pull dl.dockerpool.com:5000/ubuntu:12.04
```

完成后，即可随时使用该镜像了，例如创建一个容器，让其中运行 bash 应用。

```
$ sudo docker run -t -i ubuntu:14.10 /bin/bash
```

### 3.3. 列出本地镜像

```
$ sudo docker images
```

| REPOSITORY | TAG    | IMAGE ID     | CREATED    |
|------------|--------|--------------|------------|
| ubuntu     | 14.10  | 277eb4304907 | 3 days ago |
| 215.6 MB   |        |              |            |
| ubuntu     | latest | 5506de2b643b | 3 days ago |
| 197.8 MB   |        |              |            |

### 3.4. tag

```
docker tag ubuntu:15.10 runoob/ubuntu:v3

iMac:registry neo$ docker tag 127.0.0.1:5000/netkiller/config:latest
192.168.64.2:30050/netkiller/config:latest
```

### 3.5. 保存和载入镜像

保存镜像

```
$sudo docker save -o ubuntu_14.10.tar ubuntu:14.10
```

载入镜像

```
$ sudo docker load --input ubuntu_14.10.tar
或
$ sudo docker load < ubuntu_14.10.tar
```

### 3.6. 删除本地镜像

```
$ sudo docker rmi ubuntu:12.04
Untagged: ubuntu:12.04
```

## 强制删除所有镜像

```
docker rmi -f $(docker images -q)
```

## 3.7. history 镜像历史纪录

### 镜像历史纪录

```
# docker history centos:tomcat

## 4. 容器

### 4.1. 查看容器

```
iMac:netkiller neo$ docker container ls
```

### 4.2. 启动与终止容器

```
$ sudo docker run ubuntu:14.10 /bin/echo 'Hello world'
Hello world
```

进入BASH

```
$ sudo docker run -t -i ubuntu:14.10 /bin/bash
root@f8c7b2afff14:/#
```

start / stop / restart

```
sudo docker start silly_bohr
silly_bohr

$ sudo docker stop silly_bohr
silly_bohr

$ sudo docker restart silly_bohr
silly_bohr
```

```
[root@localhost ~]# docker container start registry
```

```
registry

[root@localhost ~]# docker ps
CONTAINER ID        IMAGE               COMMAND             CREATED
STATUS             PORTS              NAMES
fle57592f82a       registry:latest    "/entrypoint.sh /etc..." 8 days
ago                Up 6 seconds      0.0.0.0:5000->5000/tcp    registry

[root@localhost ~]# curl http://192.168.3.6:5000/v2/_catalog
{"repositories":[]}
```

## 守护进程运行

```
$ sudo docker run -d ubuntu:14.10 /bin/sh -c "while true; do echo hello
world; sleep 1; done"
4cdbb75eeabf3f1ea87bec91accdf5211639d0895e94ab94ffa1d55fb7f62e2a
```

## 通过 docker ps 命令来查看容器信息

```
$ sudo docker ps
CONTAINER ID        IMAGE               COMMAND             CREATED
STATUS             PORTS              NAMES
4cdbb75eeabf       ubuntu:14.10       "/bin/sh -c 'while t   30
seconds ago        Up 28 seconds      drunk_rosalind
```

要获取容器的输出信息，可以通过 docker logs 命令。

```
$ sudo docker logs insane_babbage
```

注意：守护进程在后台运行，所以无输出，只能通过 docker logs 命令查看

## 4.3. 进入容器

```
$ sudo docker run -idt ubuntu:14.10
793f9805620d7e10564e0778c388640cb73b6a1aec663bf468904d72a4f219f2

$ sudo docker ps
CONTAINER ID          IMAGE                COMMAND              CREATED
STATUS                PORTS               NAMES
793f9805620d         ubuntu:14.10        "/bin/bash"         5 seconds
ago                  Up 4 seconds              mad_elion

$ sudo docker attach mad_elion
root@793f9805620d:/# ls
bin boot dev etc home lib lib64 media mnt opt proc root run
sbin srv sys tmp usr var
```

## 4.4. 运行容器内的命令

```
neo@MacBook-Pro-Neo ~ % docker exec prometheus id
uid=65534(nobody) gid=65534(nogroup)
```

## 4.5. 导出和导入容器

### Ubuntu

```
$ sudo docker export 7691a814370e > ubuntu.tar
```

```
<![CDATA[
$ cat ubuntu.tar | sudo docker import - test/ubuntu:v1.0
```

指定 URL 或者某个目录来导入，例如

```
$sudo docker import http://example.com/exampleimage.tgz
example/imagerepo
```

## Mac 导出与导入

### 导出

```
iMac:tmp neo$ docker export registry -o registry.tar
```

### 导入

```
iMac:tmp neo$ docker import registry.tar  
sha256:1678c838115696f9540f168fe117ea81715b6b676497307e65d15d1ac10d9a11
```

### 指定 [REPOSITORY[:TAG]]

```
iMac:tmp neo$ docker import registry.tar registry:latest  
sha256:7b76bd807a47dcc60e41bf2f8268ecf69906bb14c2ebaa348c4c15aac716b878  
  
iMac:tmp neo$ docker images registry  
REPOSITORY          TAG                 IMAGE ID            CREATED  
SIZE  
registry            latest             7b76bd807a47       11 seconds  
ago                 26.2MB
```

## 4.6. 停止所有容器

### 杀死所有正在运行的容器

```
docker kill $(docker ps -a -q)
```

## 信号处理

--signal, -s 向容器发送信号

发送一个SIGHUP信号

```
$ docker kill -s=SIGHUP my_container
```

你可以通过名字或数字指定自定义信号，SIG前缀是可选的，例如下面的命令是等价的：

```
$ docker kill -s=SIGHUP my_container
$ docker kill -s=HUP my_container
$ docker kill -s=1 my_container
```

## 4.7. 删除容器

使用 docker rm 来删除一个处于终止状态的容器。

```
$ sudo docker ps -a
CONTAINER ID        IMAGE               COMMAND             CREATED
STATUS             PORTS              NAMES
f8c7b2afff14       ubuntu:14.10       "/bin/bash"        14
minutes ago        Exited (0) 2 minutes ago
agitated_fermat
0abd2e5fc251       ubuntu:14.10       "/bin/echo 'Hello wo  15
minutes ago        Exited (0) 15 minutes ago
clever_kowalevski

$ sudo docker rm clever_kowalevski
clever_kowalevski

$ sudo docker ps -a
CONTAINER ID        IMAGE               COMMAND             CREATED
STATUS             PORTS              NAMES
f8c7b2afff14       ubuntu:14.10       "/bin/bash"        16 minutes
ago                Exited (0) 5 minutes ago
agitated_fermat
```

```
$ docker rm  
719f98391ecf1d6f1f153ffealbbd84cd2dc9cf6d31d5a4f348c60d98392814c
```

删除所有已经停止的容器

```
docker rm $(docker ps -a -q)
```

## 4.8. log-driver

日志发送到 fluentd

```
docker run --log-driver=fluentd --log-opt fluentd-  
address=192.168.2.5:24220 ubuntu echo "Hello world"
```

## 4.9. 操作系统

设置环境变量

```
iMac:welcome neo$ docker run 127.0.0.1:5000/netkiller/welcome -e  
JAVA_OPTS="-server -Xms512m -Xmx4096m"
```

/etc/hosts 配置

```
# docker run --add-host=docker:10.180.0.1 --rm -it debian
```

向 /etc/hosts 文件内添加主机名

```
docker run -it --add-host=db.netkiller.cn:172.16.18.80 ubuntu cat /etc/hosts
```

## sysctl

```
$ docker run --sysctl net.ipv4.ip_forward=1 someimage
```

```
docker run -itd --restart=always --net=host \
--name=centos01 --hostname=centos01 \
--sysctl kernel.msgmnb=13107200 \
--sysctl kernel.msgmni=256 \
--sysctl kernel.msgmax=65536 \
--sysctl kernel.shmmax=69719476736 \
--sysctl kernel.sem='500 256000 250 1024' \
-v /mnt/ssd:/var/lib/www \
centos:latest /bin/bash

docker exec centos01 sysctl -a |grep -E \
'kernel.msgmnb|kernel.msgmni|kernel.msgmax|kernel.shmmax|kernel.sem'
```

## ulimits

查看 ulimit 设置

```
$ docker run --ulimit nofile=1024:1024 --rm debian sh -c "ulimit -n"
```

```
$ docker run -it --ulimit as=1024 fedora /bin/bash
$ docker run -d -u daemon --ulimit nproc=3 busybox top
```

```
docker run -d --ulimit nofile=20480:40960 nproc=1024:2048 nginx
```

## 4.10. 查看容器内运行的进程

```
neo@MacBook-Pro-Neo ~ % docker ps
CONTAINER ID        IMAGE                                     COMMAND                  CREATED             STATUS              PORTS
a6e33697e4bb       docker.elastic.co/elasticsearch/elasticsearch:7.9.2  "/tini -- /usr/local...  2 minutes ago      Up 2 minutes       9200/tcp, 9300/tcp
598a6e61d4fc       docker.elastic.co/kibana/kibana:7.9.2              "/usr/local/bin/dumb...  2 minutes ago      Up 2 minutes       0.0.0.0:5601->5601/tcp
bc125a658981       docker.elastic.co/elasticsearch/elasticsearch:7.9.2  "/tini -- /usr/local...  2 minutes ago      Up 2 minutes       9200/tcp, 9300/tcp
d027503bee4b       docker.elastic.co/elasticsearch/elasticsearch:7.9.2  "/tini -- /usr/local...  2 minutes ago      Up 2 minutes       0.0.0.0:9200->9200/tcp, 9300/tcp
neo@MacBook-Pro-Neo ~ % docker top 598a6e61d4fc
PID                USER              TIME              COMMAND
3077               1000              0:00              /usr/local/bin/dumb-init -- /usr/local/bin/kibana-docker
3285               1000              1:58              /usr/share/kibana/bin/../node/bin/node /usr/share/kibana/bin/../src/cli
--cpu.cgroup.path.override=/ --cpuacct.cgroup.path.override=/
```

## 4.11. 更新容器资源配置

```
neo@MacBook-Pro-Neo ~ % docker update kibana --cpus 1
```

```
kibana
```

## 4.12. 查看容器的退出状态

```
neo@MacBook-Pro-Neo ~ % docker wait a6e33697e4bb  
0
```

## 4.13. 暂停与恢复容器

暂停容器运行

```
docker pause a6e33697e4bb
```

恢复容器运行

```
docker unpause a6e33697e4bb
```

## 4.14. 对比容器的变化

查看容器启动后，修改了镜像中哪些问题

```
neo@MacBook-Pro-Neo ~ % docker diff a6e33697e4bb  
C /tmp  
A /tmp/elasticsearch-14495251404334864644  
A /tmp/hsperfdata_elasticsearch  
A /tmp/hsperfdata_elasticsearch/6  
C /usr  
C /usr/share  
C /usr/share/elasticsearch  
C /usr/share/elasticsearch/config  
A /usr/share/elasticsearch/config/elasticsearch.keystore
```

```
A /usr/share/elasticsearch/.cache
A /usr/share/elasticsearch/.cache/JNA
A /usr/share/elasticsearch/.cache/JNA/temp
C /usr/share/elasticsearch/logs
A /usr/share/elasticsearch/logs/gc.log
A /usr/share/elasticsearch/logs/gc.log.00
```

## 4.15. 查看容器状态

```
neo@MacBook-Pro-Neo ~ % docker stats
CONTAINER ID        NAME               CPU %               MEM USAGE /
LIMIT             MEM %              NET I/O            BLOCK I/O
PIDS
a6e33697e4bb       es02               0.68%               894.2MiB /
3.848GiB          22.69%             13.9MB / 6.95MB    98.9MB / 3.88MB
77
598a6e61d4fc       kibana             0.95%               462.8MiB /
3.848GiB          11.74%             718kB / 13MB       409MB / 4.1kB
12
bc125a658981       es03               2.67%               889.9MiB /
3.848GiB          22.58%             1.76MB / 5.79MB    48.5MB / 3.09MB
71
d027503bee4b       elasticsearch      2.75%               928.4MiB /
3.848GiB          23.56%             24MB / 14.7MB      139MB / 8.57MB
75
```

## 4.16. 重启容器

--time, -t 10 停止容器之前需要等待的时间(秒)

```
$ docker restart [options] container [container...]
```

## 5. 卷管理

### 5.1. 列出卷

`docker volume ls`

```
# docker volume ls
DRIVER          VOLUME NAME
local
dbac41b6de88c75d2932d5949367b17f347f482977d508195375dbc71518ab27
```

### 5.2. 创建卷

```
# docker volume create --name WebVolume1
WebVolume1
```

```
# docker volume ls
DRIVER          VOLUME NAME
local
local
dbac41b6de88c75d2932d5949367b17f347f482977d508195375dbc71518ab27
```

### 5.3. 挂在镜像

```
# docker run -ti --rm -v WebVolume1:/www ubuntu
# docker run -ti --rm -v WebVolume1:/www docker.io/centos:7
```

查看卷的挂载情况

```
# df | grep /www
/dev/vda1      20510332 7943940  11501484  41% /www
```

## 创建测试文件

```
# mkdir -p /www/netkiller.cn/www.netkiller.cn
# echo Helloworld > /www/netkiller.cn/www.netkiller.cn/index.html
# cat /www/netkiller.cn/www.netkiller.cn/index.html
Helloworld
# exit
exit
```

## 5.4. 检查卷

```
# docker volume inspect WebVolume1
[
  {
    "Driver": "local",
    "Labels": {},
    "Mountpoint": "/var/lib/docker/volumes/WebVolume1/_data",
    "Name": "WebVolume1",
    "Options": {},
    "Scope": "local"
  }
]
```

## 5.5. 删除卷

```
# docker volume create AppVolume1
# docker volume rm AppVolume1
```

## 5.6. 销毁所有未使用的卷

```
# docker volume prune
WARNING! This will remove all volumes not used by at least one container.
Are you sure you want to continue? [y/N] y
Deleted Volumes:
WebVolume1
3fd379f8c2cf8727d2e83e84e434ealf122016957bd7cf78a0f05b6e5a69cf2b
app
Total reclaimed space: 11 B
```

## 5.7. 在多个容器间共享卷

容器一

```
# docker run -ti --name=Container1 -v DataVolume1:/opt/data ubuntu
```

容器二

```
# docker run -ti --name=Container2 --volumes-from Container1 ubuntu
```

进入容器一中查看数据

```
# docker start -ai Container1
```

容器三，挂在只读卷

```
# docker run -ti --name=Container3 --volumes-from Container2:ro ubuntu
```

删除上面三个测试容器和卷

```
# docker rm Container1 Container2 Container3  
# docker volume rm DataVolume1
```

## 5.8. 容器绑定本地文件系统

**Bind mount a volume (default [])**

```
# docker run -it --name mycentos1 -v /www:/tmp/test docker.io/centos:7 /bin/bash
# docker run -d -v ~/logs:/var/log/nginx -p 80:80 -i nginx
```

## 5.9. 只读权限

/etc/redis/redis.conf:/etc/redis/redis.conf:ro 表示只读权限

```
docker run \
-p 6379:6379 \
-v /var/lib/redis:/data \
-v /etc/redis/redis.conf:/etc/redis/redis.conf:ro \
--privileged=true \
--name redis \
-d docker.io/redis:latest redis-server /etc/redis/redis.conf
```

## 6. 仓库

### 6.1. Docker 官方仓库

登陆仓库

登录

```
$ sudo docker login
Username: netkiller
Password:
Email: netkiller@msn.com
Login Succeeded
```

获取镜像

```
docker pull ubuntu:14.04
```

上传镜像

```
docker tag friendlyhello username/repository:tag
docker push username/repository:tag
```

### 6.2. 私有仓库

搭建私有仓库

搭建私有仓库只需两步

```
docker pull registry
docker run -d -p 5000:5000 -v /opt/registry:/var/lib/registry --name
registry registry
```

## 操作演示

```
neo@ubuntu:~$ docker pull registry
Using default tag: latest
latest: Pulling from library/registry
169185f82c45: Pull complete
046e2d030894: Pull complete
188836fddeeb: Pull complete
832744537747: Pull complete
7ceea07e80be: Pull complete
Digest:
sha256:870474507964d8e7d8c3b53bcfa738e3356d2747a42adad26d0d81ef4479eb1b
Status: Downloaded newer image for registry:latest

neo@ubuntu:~$ docker run -d -p 5000:5000 -v /opt/registry:/tmp/registry
registry
38a6d3b5e18e378b7765fa00374426db3a06c64f4b9219a1f85dc42a6a66ef28

neo@ubuntu:~$ docker ps | grep registry
38a6d3b5e18e      registry          "/entrypoint.sh /etc..."   35
seconds ago      Up 33 seconds     0.0.0.0:5000->5000/tcp
```

设置允许http协议访问，有两种方式，一种是修改 /etc/docker/daemon.json并添加 “insecure-registries” 项

```
{
  "registry-mirrors": ["https://registry.docker-cn.com"],
  "insecure-registries": ["127.0.0.1:5000"]
}
```

另一种方式是修改 /etc/default/docker 中加入下面内容

```
neo@ubuntu:~$ sudo vim /etc/default/docker
```

```
DOCKER_OPTS="--insecure-registry 0.0.0.0:5000"
```

修改 /lib/systemd/system/docker.service

```
# 加入
EnvironmentFile=/etc/default/docker
# 尾部加入 $DOCKER_OPTS
ExecStart=/usr/bin/dockerd -H fd:// -H unix:///var/run/docker.sock -H
tcp://0.0.0.0:2375 $DOCKER_OPTS
```

完整的例子

```
neo@ubuntu:~$ sudo vim /lib/systemd/system/docker.service

[Unit]
Description=Docker Application Container Engine
Documentation=https://docs.docker.com
After=network-online.target docker.socket firewalld.service
Wants=network-online.target
Requires=docker.socket

[Service]
Type=notify
# the default is not to use systemd for cgroups because the delegate
issues still
# exists and systemd currently does not support the cgroup feature set
required
EnvironmentFile=/etc/default/docker
# for containers run by docker
ExecStart=/usr/bin/dockerd -H fd:// -H unix:///var/run/docker.sock -H
tcp://0.0.0.0:2375 $DOCKER_OPTS
ExecReload=/bin/kill -s HUP $MAINPID
LimitNOFILE=1048576
# Having non-zero Limit*s causes performance problems due to accounting
overhead
# in the kernel. We recommend using cgroups to do container-local
accounting.
LimitNPROC=infinity
LimitCORE=infinity
# Uncomment TasksMax if your systemd version supports it.
# Only systemd 226 and above support this version.
```

```
TasksMax=infinity
TimeoutStartSec=0
# set delegate yes so that systemd does not reset the cgroups of docker
containers
Delegate=yes
# kill only the docker process, not all processes in the cgroup
KillMode=process
# restart the docker process if it exits prematurely
Restart=on-failure
StartLimitBurst=3
StartLimitInterval=60s

[Install]
WantedBy=multi-user.target
```

## 重启 Docker

```
neo@ubuntu:~$ sudo systemctl daemon-reload
neo@ubuntu:~$ sudo systemctl restart docker

neo@ubuntu:~$ ps ax | grep docker
19548 ?          Ssl      0:00 /usr/bin/dockerd -H fd:// -H
unix:///var/run/docker.sock -H tcp://0.0.0.0:2375 --insecure-registry
0.0.0.0:5000
```

## 验证 5000 端口可以访问

```
neo@ubuntu:~$ curl -XGET http://localhost:5000/v2/_catalog
{"repositories":[]}
```

## 推送镜像到私有仓库

### 本地镜像推送到远程私有仓库

```
docker pull busybox
docker tag busybox docker.netkiller.cn:5000/busybox
```

```
docker push docker.netkiller.cn:5000/busybox
```

## 操作演示

```
[root@localhost ~]# docker pull busybox
Using default tag: latest
latest: Pulling from library/busybox
697743189b6d: Pull complete
Digest:
sha256:061ca9704a714ee3e8b80523ec720c64f6209ad3f97c0ff7cb9ec7d19f15149f
Status: Downloaded newer image for busybox:latest

[root@localhost ~]# docker tag busybox docker.netkiller.cn:5000/busybox

[root@localhost ~]# docker push docker.netkiller.cn:5000/busybox
The push refers to repository [docker.netkiller.cn:5000/busybox]
adab5d09ba79: Pushed
latest: digest:
sha256:4415a904b1aca178c2450fd54928ab362825e863c0ad5452fd020e92f7a6a47e
size: 527
```

## 查看远程私有仓库

```
[root@localhost ~]# curl -XGET
http://docker.netkiller.cn:5000/v2/_catalog
{"repositories":["busybox"]}

[root@localhost ~]# curl -XGET
http://docker.netkiller.cn:5000/v2/busybox/tags/list
{"name":"busybox","tags":["latest"]}
```

## 从私有仓库拉镜像

```
docker pull docker.netkiller.cn:5000/busybox
```

## 查询镜像

[http://localhost:5000/v2/\\_catalog](http://localhost:5000/v2/_catalog)

如果我们想要查询私有仓库中的所有镜像，使用docker search命令：

```
docker search registry_ipaddr:5000/
```

如果要查询仓库中指定账户下的镜像，则使用如下命令：

```
docker search registry_ipaddr:5000/account/
```

## 操作演示

```
[root@localhost ~]# curl -XGET
http://docker.netkiller.cn:5000/v2/_catalog
{"repositories":["busybox"]}

[root@localhost ~]# curl -XGET
http://docker.netkiller.cn:5000/v2/busybox/tags/list
{"name":"busybox","tags":["latest"]}
```

## registry 镜像高级配置

/etc/docker/registry/config.yml

```
cat config.yml

version: 0.1
log:
  fields:
    service: registry
storage:
```

```
delete:
  enabled: true
cache:
  blobdescriptor: inmemory
filesystem:
  rootdirectory: /var/lib/registry
http:
  addr: :5000
  headers:
    X-Content-Type-Options: [nosniff]
health:
  storagedriver:
    enabled: true
    interval: 10s
    threshold: 3
```

私有仓库认证

## 创建密码文件

```
docker run --entrypoint htpasswd registry -Bbn testuser testpassword >
auth/htpasswd
```

## 启动 docker

```
docker run -d -p 5000:5000 --restart=always --name docker-hub \
-v /opt/registry:/var/lib/registry \
-v /opt/auth:/auth \
-e "REGISTRY_AUTH=htpasswd" \
-e "REGISTRY_AUTH_HTPASSWD_REALM=Registry Realm" \
-e REGISTRY_AUTH_HTPASSWD_PATH=/auth/htpasswd \
registry
```

## 登录

```
docker login -u testuser -p testpassword docker.netkiller.cn:5000
```

退出

```
docker logout docker.netkiller.cn:5000
```

## registry 接口

查看仓库 [http://registry:5000/v2/\\_catalog](http://registry:5000/v2/_catalog)

```
curl -XGET http://registry:5000/v2/_catalog
```

查看镜像

```
curl -XGET http://registry:5000/v2/image_name/tags/list
```

删除镜像

```
DELETE /v2/<name>/manifests/<reference>  
name: 镜像名称  
reference: 镜像对应sha256值
```

处理器测试

```
curl -I -X DELETE  
http://registry:5000/v2/netkiller/manifests/sha256:6a67ba482a8dd4f8143ac  
96b1dcffa5e45af95b8d3e37aeba72401a5afd7ab8e
```

### 6.3. Harbor

Harbor 是 Vmware 公司开源的 企业级的 Docker Registry 管理项目，它提供 Docker Registry 管理 WebUI，可基于角色访问控制,AD/LDAP 集成，日志审核等功能，完全的支持中文。

开源项目地址 <https://github.com/vmware/harbor>

## 7. Swarms

Swarm 是一组运行着Docker的机器。经过这些配置后，将节点加入到一个集群中，你仍然像之前那样运行Docker命令一样管理集群上的容器。这些命令由swarm manager在集群上执行。这些机器可以是真实的机器，也可以是虚拟机。机器加入到一个swarm后，可以称这些机器为节点(node)。

### 7.1. 管理 Swarms

#### 帮助命令

```
neo@MacBook-Pro ~ % docker-machine
Usage: docker-machine [OPTIONS] COMMAND [arg...]

Create and manage machines running Docker.

Version: 0.16.1, build cce350d7

Author:
  Docker Machine Contributors - <https://github.com/docker/machine>

Options:
  --debug, -D                                Enable debug mode
  --storage-path, -s "/Users/neo/.docker/machine" Configures storage path
  [${MACHINE_STORAGE_PATH}]
  --tls-ca-cert                                CA to verify remotes
  against [${MACHINE_TLS_CA_CERT}]
  --tls-ca-key                                Private key to generate
  certificates [${MACHINE_TLS_CA_KEY}]
  --tls-client-cert                            Client cert to use for
  TLS [${MACHINE_TLS_CLIENT_CERT}]
  --tls-client-key                            Private key used in
  client TLS auth [${MACHINE_TLS_CLIENT_KEY}]
  --github-api-token                          Token to use for requests
  to the Github API [${MACHINE_GITHUB_API_TOKEN}]
  --native-ssh                                Use the native (Go-based)
  SSH implementation. [${MACHINE_NATIVE_SSH}]
  --bugsnag-api-token                        BugSnag API token for
  crash reporting [${MACHINE_BUGSNAG_API_TOKEN}]
  --help, -h                                show help
  --version, -v                              print the version

Commands:
  active                                Print which machine is active
  config                               Print the connection config for machine
  create                               Create a machine
  env                                  Display the commands to set up the environment for the
  Docker client
  inspect                              Inspect information about a machine
  ip                                    Get the IP address of a machine
  kill                                  Kill a machine
```

|                  |   |
|------------------|---|
| ls               | List machines   |
| provision        | Re-provision existing machines                              |
| regenerate-certs | Regenerate TLS Certificates for a machine                   |
| restart          | Restart a machine   |
| rm               | Remove a machine  |
| ssh              | Log into or run a command on a machine with SSH.            |
| scp              | Copy files between machines                                 |
| mount            | Mount or unmount a directory from a machine with SSHFS.     |
| start            | Start a machine   |
| status           | Get the status of a machine                                 |
| stop             | Stop a machine  |
| upgrade          | Upgrade a machine to the latest version of Docker           |
| url              | Get the URL of a machine                                    |
| version          | Show the Docker Machine version or a machine docker version |
| help             | Shows a list of commands or help for one command            |

Run 'docker-machine COMMAND --help' for more information on a command.

## 查看 Swarms 版本

```
neo@MacBook-Pro ~ % docker-machine version
docker-machine version 0.16.1, build cce350d7
```

## 初始化 Swarms

```
neo@MacBook-Pro ~/workspace/docker/docker-compose % docker swarm init
Swarm initialized: current node (t8gqr7wfyeis9n8wuegy4j6gn) is now a manager.

To add a worker to this swarm, run the following command:

    docker swarm join --token SWMTKN-1-5w5joob510ug74m9vfn2jla4lnox3ddh6eiyrpgonm38zaoj5c-bo2q6tdem9ihd68gryuelb42x192.168.65.3:2377

To add a manager to this swarm, run 'docker swarm join-token manager' and follow the instructions.
```

## 显示 join-token

```
neo@MacBook-Pro ~ % docker swarm join-token manager
To add a manager to this swarm, run the following command:
```

```
docker swarm join --token SWMTKN-1-200v95u6lkow6wyxne11l44rhhwy1zfawnrqo39i44sqay8vp-1vltkdz94y79mgech56wtmj9n192.168.65.3:2377
```

## 创建虚拟机

使用VirtualBox驱动，创建虚拟机：

```
neo@MacBook-Pro ~ % docker-machine create --driver virtualbox vm1
neo@MacBook-Pro ~ % docker-machine create --driver virtualbox vm2
```

## 显示虚拟机列表

```
$ docker-machine ls
```

## 设置管理节点

配置虚拟机作为manager节点，用以执行管理命令并准许其他worker加入到swarm中。

```
$ docker-machine ssh vm1 "docker swarm init --advertise-addr <ip_address>"
```

## 加入到管理节点

```
$ docker-machine ssh vm2 "docker swarm join \
--token <token> \
<ip>:2377"
```

## 查看节点列表

```
$ docker-machine ssh vm1 "docker node ls"
```

## 环境变量

```
$ docker-machine env vm1
```

现在运行docker-machine ls来验证vm1就是当前的活跃机器，会有星号标识：

```
$ docker-machine ls
```

## 切换节点

```
eval $(docker-machine env vm1)
```

## 重置 shell 环境

```
neo@MacBook-Pro ~ % docker-machine env -u
unset DOCKER_TLS_VERIFY
unset DOCKER_HOST
unset DOCKER_CERT_PATH
unset DOCKER_MACHINE_NAME
# Run this command to configure your shell:
# eval $(docker-machine env -u)
```

```
eval $(docker-machine env -u)
```

## 启动/停止节点

```
$ docker-machine start vm1
```

```
$ docker-machine stop vm1
```

离线

```
docker swarm leave --force
```

## 7.2. Stack

stack 是一组相互关联的services，这些services之间相互依赖，并能够一起进行编排和scale。单个stack就能够定义和协调整个应用程序的功能。

Stack 使用 docker-compose.yml 部署，Stack 与 docker-compose 的区别是，Stack 无法 build 镜像，不支持 v2会v1 版本的 docker-compose.yml

创建 docker-compose.yml

```
version: "3"
services:
  web:
    # replace username/repo:tag with your name and image details
    image: nginx
    deploy:
      replicas: 5
      restart_policy:
        condition: on-failure
    resources:
      limits:
        cpus: "0.1"
        memory: 50M
    ports:
      - "80:80"
    networks:
      - webnet
  visualizer:
    image: dockersamples/visualizer:stable
    ports:
      - "8080:8080"
    volumes:
      - "/var/run/docker.sock:/var/run/docker.sock"
    deploy:
      placement:
```

```
    constraints: [node.role == manager]
    networks:
      - webnet
networks:
  webnet:
```

## 部署 docker-compose.yml

```
neo@MacBook-Pro ~ % docker stack deploy -c docker-compose.yml visualizer
Creating service visualizer_web
Creating service visualizer_visualizer
```

## 查看部署

```
neo@MacBook-Pro ~ % docker stack ls
NAME                SERVICES            ORCHESTRATOR
visualizer          2                   Swarm
```

```
neo@MacBook-Pro ~ % docker stack services visualizer
ID                NAME                MODE                REPLICAS
IMAGE                PORTS
h6vpdk8wqr8w      visualizer_visualizer  replicated          1/1
dockersamples/visualizer:stable *:8080->8080/tcp
tm5rre8d4kni      visualizer_web      replicated          5/5
nginx:latest      *:80->80/tcp
```

```
neo@MacBook-Pro ~ % docker stack ps visualizer
ID                NAME                IMAGE
NODE                DESIRED STATE        CURRENT STATE        ERROR

Removing service visualizer_visualizer
Removing service visualizer_web
Removing network visualizer_webnet

```

### 7.3. 服务

```

neo@MacBook-Pro ~ % docker service

Usage:  docker service COMMAND

```

## Manage services

### Commands:

|          |  |
|----------|--|
| create   | Create a new service                                 |
| inspect  | Display detailed information on one or more services |
| logs     | Fetch the logs of a service or task                  |
| ls       | List services  |
| ps       | List the tasks of one or more services               |
| rm       | Remove one or more services                          |
| rollback | Revert changes to a service's configuration          |
| scale    | Scale one or multiple replicated services            |
| update   | Update a service                                     |

Run 'docker service COMMAND --help' for more information on a command.

## 创建 Service

```
$ docker service create \
  --replicas 10 \
  --name ping_service \
  alpine ping www.netkiller.cn
```

```
$ docker service create --replicas 1 --name my-prometheus \
  --mount
type=bind,source=/tmp/prometheus.yml,destination=/etc/prometheus/prometheus.yml \
  --publish published=9090,target=9090,protocol=tcp \
  prom/prometheus
```

```
iMac:redis neo$ docker stack deploy -c redis.yml redis
Creating service redis_redis
```

## 提示

--mount 不允许使用相对路径，小技巧 `pwd` /prometheus.yml

```
docker service create --replicas 1 --name my-prometheus \
  --mount
type=bind,source=`pwd` /prometheus.yml,destination=/etc/prometheus/prometheus.yml \
  --publish published=9090,target=9090,protocol=tcp \
```

```
prom/prometheus
```

## 删除 Service

```
iMac:docker neo$ docker service rm prometheus
prometheus
```

如果是 stack 部署的也可以这样删除

```
iMac:redis neo$ docker stack rm redis
Removing service redis_redis
```

## inspect

```
iMac:redis neo$ docker service inspect redis_redis

]

```

## 7.4. Docker 网络

### 创建 overlay 网络

```

docker network create \
  --driver=overlay \
  --subnet=172.12.0.0/16 \
  --ip-range=172.12.0.0/16 \
  --gateway=172.12.0.1 \

```

```
--attachable \
test
```

```
iMac:redis neo$ docker network ls
```

| NETWORK ID   | NAME             | DRIVER  | SCOPE |
|--------------|------------------|---------|-------|
| 786efe30f42d | bridge           | bridge  | local |
| 51e2b21d7daa | docker_gwbridge  | bridge  | local |
| 96ba0de26cd2 | host             | host    | local |
| 7r7k9robn0uu | ingress          | overlay | swarm |
| cbf078a5f121 | none             | null    | local |
| d851mrlkludv | redis_default    | overlay | swarm |
| q0h9awx86ef4 | registry_default | overlay | swarm |
| cf585ea9ceb4 | registry_default | bridge  | local |
| gvcz5y66ovrl | test             | overlay | swarm |

[查看详细信息](#)

```
iMac:redis neo$ docker network inspect test
```

```
[
  {
    "Name": "test",
    "Id": "gvcz5y66ovrlqfaxb02zx026t",
    "Created": "2020-09-26T14:07:49.037581155Z",
    "Scope": "swarm",
    "Driver": "overlay",
    "EnableIPv6": false,
    "IPAM": {
      "Driver": "default",
      "Options": null,
      "Config": [
        {
          "Subnet": "172.12.0.0/16",
          "IPRange": "172.12.0.0/16",
          "Gateway": "172.12.0.1"
        }
      ]
    },
    "Internal": false,

      "com.docker.network.driver.overlay.vxlanid_list": "4104"
    },
    "Labels": null
  }
]
```

```
}  
]
```

## 7.5. swarm 卷管理

swarm 不能使用 `-v /mysite:/usr/share/nginx/html` 挂载卷，系统会提示

```
unknown shorthand flag: 'v' in -v  
See 'docker service create --help'.
```

### Host Volumes

```
$ docker service create --name nginx \  
  --mount type=bind,source=`pwd`/static-site,target=/usr/share/nginx/html \  
  -p 80:80 nginx
```

### Named Volumes

```
$ docker service create --name nginx \  
  --mount type=volume,source=web,target=/usr/share/nginx/html \  
  -p 80:80 nginx
```

## 共享卷

创建 NFS 数据共享卷

```
docker volume create --driver local \  
  --opt type=nfs4 \  
  --opt o=addr=<NFS-Server>,rw \  
  --opt device=:<Shared-Path> \  
  share
```

创建服务副本

```
docker service create \  
  --mount type=volume,source=<Volume-Name>,destination=<Container-Path> \  
  --replicas 2 \  
  <Image>
```

## 8. docker 命令

### 8.1. docker - A self-sufficient runtime for containers

查看 docker 信息

```
neo@MacBook-Pro ~ % docker info
Containers: 9
  Running: 8

**run**

run

```
$ sudo docker run ubuntu:14.04 /bin/echo 'Hello world'
Hello world
```

### start / stop / restart

```
sudo docker start silly_bohr
silly_bohr

$ sudo docker stop silly_bohr
silly_bohr

$ sudo docker restart silly_bohr
silly_bohr
```

### ps

OPTIONS说明:

- a :显示所有的容器，包括未运行的。
- f :根据条件过滤显示的内容。
- format :指定返回值的模板文件。
- l :显示最近创建的容器。
- n :列出最近创建的n个容器。
- no-trunc :不截断输出。
- q :静默模式，只显示容器编号。
- s :显示总的文件大小。

```
sudo docker ps
```

```
$ sudo docker ps -l
CONTAINER ID IMAGE COMMAND CREATED STATUS PORTS NAMES
84391d1de0fc ubuntu:14.04 /bin/echo Hello worl 31 minutes ago Exit 0 romantic_ritchie
```

### kill 信号

```
docker kill -s HUP <CONTAINER ID>
```

## top

```
$ sudo docker ps
CONTAINER ID IMAGE COMMAND CREATED STATUS PORTS NAMES
13b2a4a31455 ubuntu:14.04 /bin/bash 3 hours ago Up 3 hours silly_bohr

$ sudo docker top silly_bohr
UID PID PPID C STIME TTY TIME CMD

}]

```

获取容器名称

```

neo@MacBook-Pro ~ % docker inspect --format='{{.Name}}' $(docker ps -aq)
/redis-cli
/cluster_redisslave3_1
/cluster_redismaster3_1
/cluster_redismaster2_1
/cluster_redisslave2_1
/cluster_redismaster1_1
/cluster_redisslave1_1
/cluster_redis-image_1
/devel_eureka_1
/devel_config_1
/quizzical_heisenberg

neo@MacBook-Pro ~ % docker inspect --format='{{.Name}}' $(docker ps -aq)|cut -d"/" -f2
redis-cli
cluster_redisslave3_1
cluster_redismaster3_1
cluster_redismaster2_1
cluster_redisslave2_1
cluster_redismaster1_1
cluster_redisslave1_1

```

```
cluster_redis-image_1
devel_eureka_1
devel_config_1
quizzical_heisenberg
```

容器镜像名称

```
neo@MacBook-Pro ~ % docker inspect --format='{{.Config.Image}}' `docker ps -a -q`
netkiller/redis:latest
netkiller/redis
netkiller/redis
netkiller/redis
netkiller/redis
netkiller/redis
netkiller/redis:latest
netkiller/eureka:latest
netkiller/config:latest
netkiller/eureka
```

获取容器主机名 **Hostname**

```
neo@MacBook-Pro ~ % docker inspect --format '{{ .Config.Hostname }}' $(docker ps -q)
dbea51159085
79126b58e92a
5d1fff33a3e1
42a58cb957d9
68904b82d071
70a20dd0396d
742313f2af46
```

查询 **IP** 地址

```
$ sudo docker inspect -f '{{ .NetworkSettings.IPAddress }}' silly_bohr
```

```
neo@MacBook-Pro ~ % docker inspect --format='{{range .NetworkSettings.Networks}}
{{.IPAddress}}{{end}}' $(docker ps -q)

172.24.0.7
172.24.0.6
172.24.0.5
172.24.0.4
172.24.0.3
172.24.0.2
```

## 获取容器的MAC地址

```
neo@MacBook-Pro ~ % docker inspect --format='{{range .NetworkSettings.Networks}}{{.MacAddress}}{{end}}' $(docker ps -a -q)

02:42:ac:18:00:07
02:42:ac:18:00:06
02:42:ac:18:00:05
02:42:ac:18:00:04
02:42:ac:18:00:03
02:42:ac:18:00:02
```

## 容器日志

```
neo@MacBook-Pro ~ % docker inspect --format='{{.LogPath}}' `docker ps -a -q`
/var/lib/docker/containers/dbea511590859fee80565d1c047da2443d62f72f79627c7a97fd891b3ae41168/

```

函数

## 拆分和组合

```

neo@MacBook-Pro ~ % docker inspect --format '{{join .Config.Entrypoint " , "}}' dbea51159085
/docker-entrypoint.sh

neo@MacBook-Pro ~ % docker inspect --format '{{.HostsPath}}' dbea51159085
/var/lib/docker/containers/dbea511590859fee80565d1c047da2443d62f72f79627c7a97fd891b3ae41168/
hosts

neo@MacBook-Pro ~ % docker inspect --format '{{split .HostsPath "/"}}' dbea51159085
[ var lib docker containers dbea511590859fee80565d1c047da2443d62f72f79627c7a97fd891b3ae41168
hosts]

```

## 大小写转换

```

neo@MacBook-Pro ~ % docker inspect --format "{{lower .Name}}" dbea51159085
/redis-cli
neo@MacBook-Pro ~ % docker inspect --format "{{upper .Name}}" dbea51159085
/REDIS-CLI

```

## 首字母大写

```
neo@MacBook-Pro ~ % docker inspect --format "{{title .State.Status}}" dbea51159085
Restarting
```

## 长度计算

```
neo@MacBook-Pro ~ % docker inspect --format '{{len .Name}}' dbea51159085
10
```

## 打印字符串

```
neo@MacBook-Pro ~ % INSTANCE_ID=42a58cb957d9

neo@MacBook-Pro ~ % docker inspect --format '{{.State.Pid}}{{.State.ExitCode}}' $INSTANCE_ID
745770

neo@MacBook-Pro ~ % docker inspect --format '{{print .State.Pid .State.ExitCode}}'
$INSTANCE_ID
74577 0

neo@MacBook-Pro ~ % docker inspect --format '{{printf "Pid:%d ExitCode:%d" .State.Pid
.State.ExitCode}}' $INSTANCE_ID
Pid:74577 ExitCode:0

neo@MacBook-Pro ~ % docker inspect --format '{{.State.Pid}}{{print "|"}}{{.State.ExitCode}}'
$INSTANCE_ID
74577|0
```

## 综合查询

```
neo@MacBook-Pro ~ % docker inspect --format 'Hostname:{{ .Config.Hostname }} Name:{{.Name}}
IP:{{range .NetworkSettings.Networks}}{{.IPAddress}}{{end}}' $(docker ps -q)
Hostname:dbea51159085 Name:/redis-cli IP:
Hostname:79126b58e92a Name:/cluster_redisslave3_1 IP:172.24.0.7
Hostname:5d1fff33a3e1 Name:/cluster_redismaster3_1 IP:172.24.0.6

```

### Getting a new image

```
$ sudo docker pull centos
Pulling repository centos
b7de3133ff98: Pulling dependent layers
5cc9e91966f7: Pulling fs layer
511136ea3c5a: Download complete
ef52fb1fe610: Download complete
```

### logs

显示容器运行日志，用于排查异常情况

例如下面是nginx容易启动出错日志

```
[root@netkiller]# docker logs my-nginx-container
nginx: [emerg] invalid server name or wildcard "www.*.com" on 0.0.0.0:80
nginx: [emerg] invalid server name or wildcard "www.*.com" on 0.0.0.0:80
nginx: [emerg] invalid server name or wildcard "www.*.com" on 0.0.0.0:80
nginx: [emerg] invalid server name or wildcard "www.*.com" on 0.0.0.0:80
nginx: [emerg] invalid server name or wildcard "www.*.com" on 0.0.0.0:80
nginx: [emerg] invalid server name or wildcard "www.*.com" on 0.0.0.0:80
```

### 重置 Docker

```
docker ps -aq | xargs docker rm -f
docker images -aq | xargs docker rmi -f
```

## 仓库操作

<https://docs.docker.com/engine/reference/commandline/login/>

登陆到一个Docker镜像仓库，如果未指定镜像仓库地址，默认为官方仓库 Docker Hub

登陆

```
docker login -u 用户名 -p 密码
```

登陆到私有仓库

```
$ docker login localhost:8080
```

从标准输出传递密码

```
$ cat ~/my_password.txt | docker login --username foo --password-stdin
```

注销

```
docker logout
```

## build

```
$ docker build -f /path/to/a/Dockerfile .
```

## 网络管理

```
docker network create -d bridge --subnet 172.25.0.0/16 private_network

docker run -d -v /usr/local/etc/redis/redis.conf:/usr/local/etc/redis/redis.conf -p
6379:6379 --network=private_network --name redis redis-server
/usr/local/etc/redis/redis.conf
```

## 事件信息

```
neo@MacBook-Pro-Neo ~ % docker events
2020-10-22T21:29:44.289075472+08:00 network create
8eab34642596e253eb51aa40cc4f5c4c14fb88f1bad7c8cbdeacc2ad411cdb44 (name=search_elastic,
type=bridge)
2020-10-22T21:29:44.304732058+08:00 volume create search_data01 (driver=local)
2020-10-22T21:29:44.319023013+08:00 volume create search_data02 (driver=local)
2020-10-22T21:29:44.331507541+08:00 volume create search_data03 (driver=local)
2020-10-22T21:29:44.584989392+08:00 volume create search_data01 (driver=local)
```

## 从 docker 中复制文件

```
neo@MacBook-Pro-Neo ~ % docker cp 13acbc98fb35:/etc/nginx/nginx.conf nginx/conf
```

## 8.2. docker-compose - Define and run multi-container applications with Docker.

### Docker Compose v3

#### 安装 docker-compose

使用 pip 安装

```
yum install -y python-pip
pip install docker-compose
```

#### OSCM 安装

```
curl -s https://raw.githubusercontent.com/oscm/shell/master/virtualization/docker/docker-
compose.sh | bash
```

#### 查看版本号

```
[root@localhost ~]# docker-compose version
docker-compose version 1.29.2, build 5becea4c
docker-py version: 5.0.0
CPython version: 3.7.10
OpenSSL version: OpenSSL 1.1.0l 10 Sep 2019
```

## 快速入门

```
[root@localhost tmp]# cat app.py
import time

import redis
from flask import Flask

app = Flask(__name__)
cache = redis.Redis(host='redis', port=6379)

def get_hit_count():
    retries = 5
    while True:
        try:
            return cache.incr('hits')
        except redis.exceptions.ConnectionError as exc:
            if retries == 0:
                raise exc
            retries -= 1
            time.sleep(0.5)

@app.route('/')
def hello():
    count = get_hit_count()
    return 'Hello World! I have been seen {} times.\n'.format(count)

if __name__ == "__main__":
    app.run(host="0.0.0.0", debug=True)
```

```
[root@localhost tmp]# cat requirements.txt
flask
redis
```

```
[root@localhost tmp]# cat Dockerfile
FROM python:3.4-alpine
ADD . /code
WORKDIR /code
RUN pip install -r requirements.txt
CMD ["python", "app.py"]
```

```
[root@localhost tmp]# cat docker-compose.yml
version: '2'
services:
  web:
    build: .
    ports:
```

```
- "5000:5000"
redis:
  image: "redis:alpine"
```

## 启动

`docker-compose up`

```
[root@localhost docker]# docker-compose up
```

## 守护进程

```
docker-compose up -d
```

## 启动指定服务

```
[root@localhost docker]# docker-compose up mysql
[root@localhost docker]# docker-compose up -d mysql
```

## 指定 yml 文件

```
$ docker-compose -f docker-compose.yml up -d
```

## 停止

停止

`docker-compose down`

```
[root@localhost docker]# docker-compose down
Removing docker_membersrv_1 ... done
```

启动

查看进程

docker-compose ps

```
[root@localhost docker]# docker-compose ps
```

| Name             | Command                        | State | Ports  |
|------------------|--------------------------------|-------|--|
| -----            |                                |       |  |
| test_membersrv_1 | membersrv                      | Up    | 0.0.0.0:7054->7054/tcp   |
| test_vp0_1       | sh -c sleep 5; peer node s ... | Up    | 0.0.0.0:7050->7050/tcp, 0.0.0.0:7051->7051/tcp, 0.0.0.0:7053->7053/tcp |

查看日志

```
docker-compose logs -f vp0
```

执行命令

```
docker-compose exec vp0 bash
```

运行

```
docker-compose run vp0 bash
```

## 9. 基于 Dockerfile 创建镜像

为什么要自己创建镜像呢？因为官方提供的镜像无法满足我们的需求，例如 nginx 镜像你会发现 ps, top 等等很多命令缺失。

### 9.1. 创建 Dockerfile 文件

需求基于centos7镜像创建nginx stable最新版本镜像

```
#####  
# Dockerfile to build Nginx container  
# Based on centos7  
#####  
  
FROM centos:latest  
  
MAINTAINER Netkiller <netkiller@msn.com>  
  
# Install EPEL  
RUN yum install -y epel-release && yum clean all  
  
# Update RPM Packages  
RUN yum -y update  
  
# Install Nginx  
RUN rpm -ivh http://nginx.org/packages/centos/7/noarch/RPMS/nginx-release-centos-7-0.el7ngx.noarch.rpm  
RUN yum install -y nginx  
RUN yum clean all  
  
# forward request and error logs to docker log collector  
RUN ln -sf /dev/stdout /var/log/nginx/access.log  
RUN ln -sf /dev/stderr /var/log/nginx/error.log  
  
# be backwards compatible with pre-official images  
#RUN ln -sf ../share/nginx /usr/local/nginx  
  
# prepare container  
  
# add startup script  
#ADD startup.sh /startup.sh  
#RUN chmod 755 /startup.sh  
  
VOLUME ["/etc/nginx"]  
VOLUME ["/usr/share/nginx/html"]  
VOLUME ["/var/www"]
```

```
EXPOSE 80 443
```

```
CMD ["nginx", "-g", "daemon off;"]
```

## 9.2. 创建镜像

```
          # docker build -t "centos:nginx" .
Sending build context to Docker daemon 3.072 kB
Step 1/14 : FROM centos:latest
----> 3bee3060bfc8
Step 2/14 : MAINTAINER Netkiller <netkiller@msn.com>
----> Using cache
----> 8f351964d568
Step 3/14 : RUN yum install -y epel-release && yum clean all
----> Using cache
----> bf86eff77ff3
Step 4/14 : RUN yum -y update
----> Using cache
----> 4915172ac4f3
Step 5/14 : RUN rpm -ivh
http://nginx.org/packages/centos/7/noarch/RPMS/nginx-release-centos-7-
0.el7ngx.noarch.rpm
----> Using cache
----> 4a919bd141c9
Step 6/14 : RUN yum install -y nginx
----> Using cache
----> 2718221eab8c
Step 7/14 : RUN yum clean all
----> Using cache
----> 62231a5f1d76
Step 8/14 : RUN ln -sf /dev/stdout /var/log/nginx/access.log
----> Using cache
----> 38be8f0cc782
Step 9/14 : RUN ln -sf /dev/stderr /var/log/nginx/error.log
----> Using cache
----> bbf3a468d24f
Step 10/14 : VOLUME /etc/nginx
----> Using cache
----> 919292c7ce04
Step 11/14 : VOLUME /usr/share/nginx/html
----> Using cache
----> c2aeb8ed3c1c
Step 12/14 : VOLUME /var/www
----> Using cache
----> 31849cb8a9d0
Step 13/14 : EXPOSE 80 443
```

```
---> Using cache
---> 0e3d3b4a215b
Step 14/14 : CMD nginx -g daemon off;
---> Using cache
---> d5f21e409690
Successfully built d5f21e409690
```

## 查看镜像

```
# docker image ls
```

| REPOSITORY | TAG    | IMAGE ID     | CREATED       |
|------------|--------|--------------|---------------|
| centos     | nginx  | d5f21e409690 | 4 minutes ago |
| centos     | latest | 3bee3060bfc8 | 2 days ago    |
| nginx      | latest | 958a7ae9e569 | 8 days ago    |
| redis      | latest | a858478874d1 | 2 weeks ago   |

## 9.3. 运行镜像

```
# docker run --name my-centos-nginx -d centos:nginx
ecf342ddd66d1d5f3d28c583ec852c05903ef4813fcb75295c907a6b578dea3d
```

```
# docker ps
```

| CONTAINER ID | IMAGE        | COMMAND                | CREATED        |
|--------------|--------------|------------------------|----------------|
| ecf342ddd66d | centos:nginx | "nginx -g 'daemon ..." | 23 seconds ago |
| 0df3b275bb03 | nginx        | "nginx -g 'daemon ..." | 6 hours ago    |
| 1c4540d8617f | redis        | "docker-entrypoint..." | 2 days ago     |

## 9.4. 测试 Nginx

```
[root@netkiller]~/docker/nginx# docker exec -it my-centos-nginx /bin/bash

[root@netkiller-docker /]# ps ax
  PID TTY          STAT       TIME COMMAND
    1 ?            Ss          0:00 nginx: master process nginx -g daemon off;
    7 ?            S           0:00 nginx: worker process
    8 ?            Ss          0:00 /bin/bash
   22 ?            R+          0:00 ps ax

[root@netkiller-docker /]# curl http://localhost
<!DOCTYPE html>
<html>
<head>
<title>Welcome to nginx! </title>
<style>
    body {
        width: 35em;
        margin: 0 auto;
        font-family: Tahoma, Verdana, Arial, sans-serif;
    }
</style>
</head>
<body>
<h1>Welcome to nginx! </h1>
<p>If you see this page, the nginx web server is successfully installed
and
working. Further configuration is required.</p>

<p>For online documentation and support please refer to
<a href="http://nginx.org/">nginx.org</a>.<br/>
Commercial support is available at
<a href="http://nginx.com/">nginx.com</a>.</p>

<p><em>Thank you for using nginx.</em></p>
</body>
</html>
```

## 9.5. 提交镜像

```
# docker commit my-centos-nginx netkiller/centos:nginx
sha256:9ea1851b1c9f04aa3168977f666337223d09e20983f7a2c2328e15132a03d224
```

```
# docker push netkiller/centos:nginx
The push refers to a repository [docker.io/netkiller/centos]
16916856eaaa: Pushed
6172d61b45f1: Pushed

9e3cea652b37: Pushed
dc1e2dc7b6: Mounted from library/centos
nginx: digest:
sha256:ad9bd1ae3a3e17dac70f32afc14baf90932949d3eaa8bebbe907726aca3ea336
size: 2205
```

## 9.6. Dockerfile 语法

### COPY

跨容器拷贝

```
FROM demo/test:latest as netkiller

MAINTAINER Netkiller <netkiller@msn.com>

RUN mkdir /www

COPY some/path/to/ /www/

FROM nginx:1.13-alpine

RUN rm -rf /usr/share/nginx/html/*
COPY --from=netkiller /www/ /usr/share/nginx/html/
```

--from 参数

```
# Install the base requirements for the app.
```

```

# This stage is to support development.
FROM python:alpine AS base
WORKDIR /app
COPY requirements.txt .
RUN pip install -r requirements.txt

# Run tests to validate app
FROM node:12-alpine AS app-base
WORKDIR /app
COPY app/package.json app/yarn.lock ./
RUN yarn install
COPY app/spec ./spec
COPY app/src ./src
RUN yarn test

# Clear out the node_modules and create the zip
FROM app-base AS app-zip-creator
RUN rm -rf node_modules && \
    apk add zip && \
    zip -r /app.zip /app

# Dev-ready container - actual files will be mounted in
FROM base AS dev
CMD ["mkdocs", "serve", "-a", "0.0.0.0:8000"]

# Do the actual build of the mkdocs site
FROM base AS build
COPY . .
RUN mkdocs build

# Extract the static content from the build
# and use a nginx image to serve the content
FROM nginx:alpine
COPY --from=app-zip-creator /app.zip
/usr/share/nginx/html/assets/app.zip
COPY --from=build /app/site /usr/share/nginx/html

```

## EXPOSE

EXPOSE 是声明端口，容器内运行的程序使用了什么端口

```
EXPOSE <端口1> [<端口2>...]
```

## ENTRYPOINT

从命令行传递参数给容器

```
FROM ubuntu
ENTRYPOINT [ "top", "-b" ]
```

运行下面的命令：

```
$ docker run --rm test1 -c
```

实际 Docker 内部

```
top -b -c
```

ENTRYPOINT 与 CMD 组合

```
FROM ubuntu
ENTRYPOINT [ "top", "-b" ]
CMD [ "-c" ]
```

## 10. docker-compose.yml 容器编排

本章节介绍如何定义 docker-compose.yml 文件

首先创建项目目录

```
mkdir docker
cd docker
vim      docker-compose.yml
```

### 10.1. 版本号

```
version: '3.8'
```

### 10.2. 镜像

image: mysql:5.7 表示使用 mysql:5.7 镜像, image: mysql:latest 表示 mysql 最新版

```
services:
  db:
    image: mysql:5.7
    volumes:
      - db_data:/var/lib/mysql
    restart: always
    environment:
      MYSQL_ROOT_PASSWORD: somewordpress
      MYSQL_DATABASE: wordpress
      MYSQL_USER: wordpress
      MYSQL_PASSWORD: wordpress
```

### 10.3. 容器名称

```
prometheus:
  image: prom/prometheus
  container_name: prometheus
```

### 10.4. 启动策略

```
restart: unless-stopped
```

### 10.5. 容器用户

```
# Define in docker-compose:

services:
  prometheus:
    image: prom/prometheus
    user: "1000:1000"

services:
  prometheus:
    image: prom/prometheus
    user: root

# Dockerfile
USER 1000:1000
```

## 10.6. 挂在卷

```
volumes:
  - db_data:/var/lib/mysql
```

## 10.7. 映射端口的标签

将容器中的端口 暴露给宿主主机。

```
ports:
  - "3000"
  - "80:80"
  - "22:22"
  - "127.0.0.1:8000:8000"
```

默认 "端口 :端口 " 将监听 127.0.0.1 主机。如果需要将端口 暴露出去，格式是"IP:PORT:PORT"，IP地址是宿主主机的网络适配器IP地址。

## 10.8. 添加 hosts 文件

往/etc/hosts文件中添加主机名，与Docker client的--add-host类似：

```
extra_hosts:
  - "orderer.example.com:10.130.116.8"
  - "peer0.org1.example.com:10.130.116.9"
  - "peer1.org1.example.com:10.130.116.10"
  - "peer0.org2.example.com:10.130.116.25"
  - "peer1.org2.example.com:10.130.116.27"
```

## 10.9. links

links的作用是在当前服务里面创建一个链接外部服务的别名。

docker-compose.yml

```
services:
  tomcat:
    image: netkiller:latest
    links:
      - mysql:db.netkiller.cn
```

这时配置文件 application.properties 就可以这样些

```
sql.mysql.jdbc-url=jdbc:mysql://db.netkiller.cn:3306/test?
characterEncoding=utf8&serverTimezone=UTC&autoReconnect=true&use
SSL=false
sql.mysql.username=root
sql.mysql.password=abcdef
sql.mysql.driverClassName=com.mysql.jdbc.Driver
```

## 10.10. 服务依赖

通过depends\_on告诉docker-compose当前服务启动之前先要把depends\_on指定的服务启动起来才行。

```
services:
  kafka:
    image: tflinux_kafka
    depends_on:
      - zookeeper
```

```
spring:
  image: springboot
  depends_on:
    - redis
    - mysql
```

## 10.11. working\_dir

```
working_dir
```

## 10.12. 设置环境变量

environment 实现容器中环境变量的定义

```
version: '3'

networks:
  basic:

services:
  tools:
    container_name: tools
    image: hyperledger/fabric-tools
    tty: true
    environment:
      - GOPATH=/opt/gopath
      - CORE_VM_ENDPOINT=unix:///host/var/run/docker.sock
      - CORE_LOGGING_LEVEL=DEBUG
      - CORE_PEER_ID=cli
      - CORE_PEER_ADDRESS=peer0.org1.example.com:7051
      - CORE_PEER_LOCALMSPID=Org1MSP
      -
    CORE_PEER_MSPCONFIGPATH=/opt/gopath/src/github.com/hyperledger/fabric/peer/crypto/peerOrganizations/org1.example.com/users/Admin@org1.example.com/msp
```

```
- CORE_CHAINCODE_KEEPALIVE=10
# working_dir:
/opt/gopath/src/github.com/hyperledger/fabric/peer
working_dir: /root/netkiller
command: /bin/bash
volumes:
  - /var/run:/host/var/run/
  - ~/netkiller:/root/netkiller
  - ./chaincode:/opt/gopath/src/github.com/
  -
./crypto:/opt/gopath/src/github.com/hyperledger/fabric/peer/crypto/
networks:
  - basic
```

## 10.13. 临时文件系统

挂载临时目录到容器:

```
tmpfs: /run
tmpfs:
  - /run
  - /tmp
```

## 10.14. 编译 Dockerfile

编译当前目录下的 Dockerfile 使用 build: .

```
version: '3'
services:
  web:
    build: .
    ports:
      - "5000:5000"
```

## 指定镜像名称

```
version: "3.7"
services:
  redis-image:
    build:
      context: .
      dockerfile: Dockerfile
      args:
        - node=master
    image: netkiller/redis:latest
    container_name: redis
    restart: always
    ports:
      - "6379:6379"
    networks:
      - redis
    privileged: true
    sysctls:
      net.core.somaxconn: '511'
    ulimits:
      nproc: 65535
      nofile:
        soft: 65535
        hard: 65535
```

## docker-compose build redis-image 构建镜像

```
neo@MacBook-Pro ~/workspace/docker/docker-compose/redis/cluster
% docker-compose build redis-image
Building redis-image
Step 1/12 : FROM redis:latest
---> a55fbf438dfd
Step 2/12 : ARG node
---> Using cache
---> 4deb8fc1e1df
```

```

Step 3/12 : ENV REDIS_PORT 6379
---> Using cache
---> 5723ff2fe55c
Step 4/12 : COPY redis.conf /etc/redis/redis.conf
---> Using cache
---> daf496f8c342
Step 5/12 : COPY docker-entrypoint.sh /usr/local/bin/
---> Using cache
---> 600ae3b0c059
Step 6/12 : RUN ln -sf /usr/share/zoneinfo/Asia/Shanghai
/etc/localtime
---> Using cache
---> 630e3813bc8f
Step 7/12 : RUN echo 'Asia/Shanghai' >/etc/timezone
---> Using cache
---> 7d48350d6621
Step 8/12 : RUN echo 'echo never >
/sys/kernel/mm/transparent_hugepage/enabled' > /etc/rc.local
---> Using cache
---> c096dc75da72
Step 9/12 : RUN chmod +rw /etc/redis/redis.conf
---> Using cache
---> 25d8b0ac8893
Step 10/12 : EXPOSE $REDIS_PORT
---> Using cache
---> 99f31a88d2ff
Step 11/12 : ENTRYPOINT ["/usr/local/bin/docker-entrypoint.sh"]
---> Using cache
---> ef98f89610ae
Step 12/12 : CMD [ "redis-server", "/etc/redis/redis.conf" ]
---> Using cache
---> 095823650068

Successfully built 095823650068
Successfully tagged netkiller/redis:latest

neo@MacBook-Pro ~/workspace/docker/docker-compose/redis/cluster
% docker images | grep netkiller/redis
netkiller/redis          latest
095823650068             8 minutes ago           95MB

```

## 10.15. resources 硬件资源分配

```
version: "3"
services:
  node:
    build:
      context: .
      dockerfile: ./Dockerfile
    restart: always
    environment:
      - HOST=localhost
    volumes:
      - logs:/app/logs
    expose:
      - 8080
    deploy:
      resources:
        limits:
          cpus: '0.001'
          memory: 50M
        reservations:
          cpus: '0.0001'
          memory: 20M
```

## 提示

注意：启动必须加入 `--compatibility` 选项

```
docker-compose --compatibility up
```

## 11. Docker Example

### 11.1. registry

```
docker run -d -p 5000:5000 --name registry registry:latest
```

#### Auth + SSL

```
iMac:registry neo$ mkdir etc
iMac:registry neo$ htpasswd -Bbn neo chen > etc/htpasswd

or

docker run --entrypoint htpasswd registry:2 -Bbn neo passw0rd >
etc/htpasswd
```

```
docker run -d \
  --restart=always \
  --name registry \
  -v `pwd`/etc:/usr/local/etc \
  -e "REGISTRY_AUTH=htpasswd" \
  -e "REGISTRY_AUTH_HTPASSWD_REALM=Registry Realm" \
  -e REGISTRY_AUTH_HTPASSWD_PATH=/usr/local/etc/htpasswd \
  -e REGISTRY_HTTP_ADDR=0.0.0.0:443 \
  -e REGISTRY_HTTP_TLS_CERTIFICATE=/usr/local/etc/domain.cer \
  -e REGISTRY_HTTP_TLS_KEY=/usr/local/etc/domaon.key \
  -p 443:443 \
  registry:2
```

## 11.2. Example Java - Spring boot with Docker

### 获取 CentOS 7 镜像

```
docker pull centos:7
```

```
# docker pull centos:7
7: Pulling from library/centos
343b09361036: Pull complete
Digest:
sha256:bbaalde7c9d900a898e3cadbae040dfe8a633c06bc104a0df76ae24483e03c077
Status: Downloaded newer image for centos:7
```

### 基于 CentOS 7 运行一个容器

```
docker run -it --name mycentos docker.io/centos:7 /bin/bash
```

```
# docker run -it --name mycentos docker.io/centos:7 /bin/bash
```

运行后直接进入了容器的shell控制台默认是bash

### 安装 openjdk

```
# yum install -y java-1.8.0-openjdk

# cat >> /etc/profile.d/java.sh <<'EOF'
export JAVA_HOME=/usr/java/default
export JAVA_OPTS="-server -Xms2048m -Xmx4096m -Djava.io.tmpdir=/tmp -
Djava.security.egd=file:/dev/./urandom -Dfile.encoding=UTF8 -
Duser.timezone=GMT+08"
export CLASSPATH=$JAVA_HOME/lib:$JAVA_HOME/jre/lib:.
export PATH=$PATH:$JAVA_HOME/bin:$JAVA_HOME/jre/bin:
EOF

# source /etc/profile.d/java.sh
```

## 检查Java是否安装成功

```
# whereis java
java: /usr/bin/java /usr/lib/java /etc/java /usr/share/java
/usr/share/man/man1/java.1.gz

# java -version
openjdk version "1.8.0_131"
OpenJDK Runtime Environment (build 1.8.0_131-b11)
OpenJDK 64-Bit Server VM (build 25.131-b11, mixed mode)
```

## 创建应用程序目录

```
# mkdir -p /www/netkiller.cn/www.netkiller.cn/
```

## 推出当前容器

```
# exit
```

## Spring boot 包

### 复制 jar 文件到Docker容器

```
docker cp /www/netkiller.cn/www.netkiller.cn/www.netkiller.cn-0.0.1.war
mycentos:/usr/local/libexec
```

## 启动 Spring boot 项目

### 启动容器

```
# docker start mycentos
mycentos
```

## 进入容器

```
# docker exec -it mycentos /bin/bash
```

## 如果仅仅是测试可以手动启动 Srping boot 项目

```
# cat >> /root/run.sh <<EOF
java -server -Xms2048m -Xmx8192m -jar
/usr/local/libexec/www.netkiller.cn-0.0.1.war
EOF

chmod u+x /root/run.sh
```

## 生产环境请使用启动脚本

```
# curl -s
https://raw.githubusercontent.com/oscm/build/master/Application/Spring/s
ervice/springbootd -o /etc/init.d/springbootd
# chmod +x /etc/init.d/springbootd
```

## 编辑启动脚本 /etc/init.d/springbootd 修改下面配置项

```
#####
BASEDIR="/www/netkiller.cn/api.netkiller.cn"
JAVA_HOME=/srv/java
JAVA_OPTS="-server -Xms2048m -Xmx8192m -
Djava.security.egd=file:/dev/./urandom"
PACKAGE="api.netkiller.cn-0.0.2-release.jar"
CONFIG="--spring.config.location=$BASEDIR/application.properties"
USER=www
#####
NAME=springbootd
```

```
PROG="$JAVA_HOME/bin/java $JAVA_OPTS -jar $BASEDIR/$PACKAGE $CONFIG"  
LOGFILE=/var/tmp/$NAME.log  
PIDFILE=/var/tmp/$NAME.pid  
ACCESS_LOG=/var/tmp/$NAME.access.log  
#####
```

你也可以使用 systemd 启动脚本，详见《Netkiller Java 手札》

## 基于 CentOS 7 制作 spring 镜像

docker commit mycentos springboot:1

```
# docker commit mycentos springboot:1  
sha256:757d92d642d1b5a7b244f6ddf89f24a8d463d154438651c83ba51a644b401782
```

启动 spring boot 容器

```
# docker run -d --name springboot -p 80:8080 springboot:1 /root/run.sh
```

-d: 以守护进程方式启动  
--name: 指定容器的名称  
-p: 映射容器8080端口到宿主机的80端口  
springboot:1 : 上一步制作好的springboot镜像,版本号为1

启动容器

```
# docker start springboot
```

停止容器

```
# docker stop springboot
```

### 11.3. Redis

<http://download.redis.io/redis-stable/redis.conf>

<http://download.redis.io/redis-stable/sentinel.conf>

#### Docker 命令

获取 Redis 镜像

```
docker pull redis
```

```
# docker pull redis
Using default tag: latest
latest: Pulling from library/redis
10a267c67f42: Pull complete
5b690bc4eaa6: Pull complete
4cdd94354d2a: Pull complete
71c1f30d820f: Pull complete
c54584150374: Pull complete
d1f9221193a6: Pull complete
d45bc46b48e4: Pull complete
Digest:
sha256:548a75066f3f280eb017a6ccda34c561ccf4f25459ef8e36d6ea582b6af1decf
Status: Downloaded newer image for redis:latest
```

启动一个 Redis 实例

```
# docker run --name my-redis -d redis
10207174e18f61290f9c869e6437fa787e459e07b076b82cedf800a8c37c515d
```

查看启动情况

```
# docker ps
```

| CONTAINER ID | IMAGE        | COMMAND                | CREATED  |
|--------------|--------------|------------------------|----------|
| 10207174e18f | redis        | "docker-entrypoint..." | 8        |
| minutes ago  | Up 8 minutes | 6379/tcp               | my-redis |

进入 **Redis**

```
# docker run -it --link my-redis:redis --rm redis redis-cli -h redis -p 6379
redis:6379> set name neo
OK
redis:6379> get name
"neo"
redis:6379> exit
```

启动一个 **Redis** 实例并映射 **6379** 端口

```
# docker stop my-redis
my-redis

# docker rm my-redis
my-redis

# docker run --name my-redis -d -p 6379:6379 redis
10207174e18f61290f9c869e6437fa787e459e07b076b82cedf800a8c37c515d

# docker ps -a
```

| CONTAINER ID | IMAGE       | COMMAND                | CREATED  |
|--------------|-------------|------------------------|----------|
| 1c4540d8617f | redis       | "docker-entrypoint..." | 2        |
| seconds ago  | Up 1 second | 0.0.0.0:6379->6379/tcp | my-redis |

检查端口

```
# ss -lnt | grep 6379
LISTEN      0          128          :::6379          :::*
```

维护容器

使用下面命令进入容器维护 Redis

```
# docker exec -it my-redis /bin/bash
root@1c4540d8617f:/data#

root@1c4540d8617f:/data# redis-server -v
Redis server v=3.2.9 sha=00000000:0 malloc=jemalloc-4.0.3 bits=64
build=a30533b464d1689b
```

## Docker compose

```
version: "3.7"
services:
  redis:
    image: redis:latest
    container_name: redis
    ports:
      - "6379:6379"
    volumes:
      - redis_data:/var/lib/redis
    restart: always
    networks:
      - dev
networks:
  dev:
    driver: bridge
volumes:
  redis_data:
```

## Docker Stack

```
version: '3.8'

services:
  redis:
    image: redis:latest
    environment:
      - TZ=Asia/Shanghai
    hostname: redis
    ports:
      - 6379:6379
    networks:
      - test
    volumes:
      - data:/var/lib/redis
    configs:
      - source: config
        target: /usr/local/etc/redis.conf
        mode: 0440
    deploy:
      replicas: 1
      restart_policy:
        condition: on-failure
      resources:
        limits:
          cpus: "1"
          memory: 512M
      update_config:
        parallelism: 1
        delay: 5s
        monitor: 10s
        max_failure_ratio: 0.1
        order: start-first

configs:
  config:
    file: ./redis.conf

volumes:
  data:

networks:
  test:
    driver: overlay
```

下载 配置文件 <https://redis.io/topics/config>

```
iMac:redis neo$ curl -sO
https://raw.githubusercontent.com/redis/redis/6.0/redis.conf
iMac:redis neo$ egrep -v "^#|^$" redis.conf
```

## 修改配置文件

```
bind 0.0.0.0
logfile "/var/log/redis/redis.log"
dir /var/lib/redis
appendonly yes
```

## 创建 Docker 网络

```
iMac:redis neo$ docker network create \
> --driver=overlay \
> --subnet=172.12.0.0/16 \
> --ip-range=172.12.0.0/16 \
> --gateway=172.12.0.1 \
> --attachable \
> test
gvcz5y66ovrlqfaxb02zx026t

iMac:redis neo$ docker network ls

| NETWORK ID   | NAME             | DRIVER  | SCOPE |
|--------------|------------------|---------|-------|
| 786efe30f42d | bridge           | bridge  | local |
| 51e2b21d7daa | docker_gwbridge  | bridge  | local |
| 96ba0de26cd2 | host             | host    | local |
| 7r7k9robn0uu | ingress          | overlay | swarm |
| cbf078a5f121 | none             | null    | local |
| d851mrlkludv | redis_default    | overlay | swarm |
| q0h9awx86ef4 | registry_default | overlay | swarm |
| cf585ea9ceb4 | registry_default | bridge  | local |
| gvcz5y66ovrl | test             | overlay | swarm |

iMac:redis neo$ docker stack deploy -c redis.yml redis
Creating network redis_default
Creating service redis_redis
```

## 查看服务

```
iMac:redis neo$ docker service ls
```

| ID              | NAME              | MODE       | REPLICAS |
|-----------------|-------------------|------------|----------|
| 1ti2ndlpdhm8    | redis_redis       | replicated | 0/1      |
| redis:latest    | *:6379->6379/tcp  |            |          |
| lw6xjrl0sn88    | registry_registry | replicated | 1/1      |
| registry:latest | *:5000->5000/tcp  |            |          |

## 查看容器运行状态

```
iMac:redis neo$ docker container ls
```

| CONTAINER ID                            | IMAGE         | COMMAND                  | CREATED |
|---|---------------|--------------------------|---------|
| STATUS                                  | PORTS         | NAMES                    |         |
| 8407fd8fe66b                            | redis:latest  | "docker-entrypoint.s..." | 29      |
| seconds ago                             | Up 29 seconds | 6379/tcp                 |         |
| redis_redis.1.6fpqt3pdti03j9swn3x04ob9n |               |                          |         |

## 11.4. Nginx

本例子使用 alpine 版本

### nginx:latest

过程 1.1.

```
1. [root@iZj6ciilv2rcpgauqg2uuwZ]~# docker pull nginx
Using default tag: latest
latest: Pulling from
library/nginx
Digest:
sha256:41ad9967ea448d7c2b203c699b429abe1ed5af331cd92533900c6d77490e0
268
Status: Image is up to date
for nginx:latest
```

## 2. 启动容器

```
docker run --name my-nginx-container -p 80:80 -d nginx
```

上面不能满足生产环境的需求，通常不会将数据放在容器中，我的做法如下。

```
docker rm my-nginx-container -f
docker run --name my-nginx-container \
    -v /srv/nginx/nginx.conf:/etc/nginx/nginx.conf:ro \
    -v /srv/nginx/conf.d:/etc/nginx/conf.d:ro \
    -v /var/log/nginx:/var/log/nginx:rw \
    -v /www:/www:ro \
    -p 80:80 -d nginx
docker ps
```

## 安装 Docker Nginx alpine

### 过程 1.2. Docker nginx

#### 1. 获取镜像

```
# docker pull nginx:alpine
```

#### 2. 运行容器

```
docker run --name my-nginx-container -v /srv/nginx:/etc/nginx:ro -v /www:/www:ro -p 80:80 -d nginx:alpine
```

#### 3.

```
docker exec -it my-nginx-
```

```
container /bin/bash
```

## 安装依赖工具

```
apt update -y && apt install -y procps
```

## 容器内优雅重启

首先观察一个现象，打开 linux 终端窗口，查看 nginx 进程。

```
[root@localhost ~]# ps ax | grep nginx
 6670 ?        Ss      0:00 nginx: master process /usr/sbin/nginx
 6671 ?        S        0:00 nginx: worker process
 6672 ?        S        0:00 nginx: worker process
 6673 ?        S        0:00 nginx: worker process
 6674 ?        S        0:00 nginx: worker process
 9396 pts/0    S+      0:00 grep --color=auto nginx
```

6670 ~ 6674 都是 nginx 的进程，其中 6670 nginx: master process /usr/sbin/nginx 是父进程，用于监听 80/443 端口。6671 ~ 6674 nginx: worker process 是子进程，每个进程中又产生多线程，每个线程对应一次用户TCP请求。

6671 ~ 6674 子进程的进程ID会变化，而 6670 是不变的。6670 父进程可以接收操作系统传递过来的信号（不懂信号的同学请恶补，信号，共享内存，管道，Socket 可以实现进程间通信），也就是我们可以告诉正在运行的进程，现在要干什么。

给 6670 进程发送 HUP 信号，nginx 就会重新读取配置文件，刷新缓存，此时 6671~ 6674 不受影响，会继续为用户系统TCP链接服务，直到都安全Close为止。此时 6670 父进程已经完成配置的更新，6671~ 6674 也完成了它的使命，下一次新用户过来 nginx 就会创建新的进程，这个过程是无缝的，用户感知不到，80/443 端口始终提供服务，不会有任何用户出现中断链接的情况。

现在来演示一下，执行 reload 就会刷新配置文件，清空缓存，同时会将闲置的 nginx: worker process 关闭，并开启新的子进程。

```
[root@localhost ~]# systemctl reload nginx
[root@localhost ~]# ps ax | grep nginx
 6670 ?        Ss        0:00 nginx: master process /usr/sbin/nginx
 6671 ?        S         0:01 nginx: worker process is shutting down
 9403 ?        S         0:00 nginx: worker process
 9404 ?        S         0:00 nginx: worker process
 9405 ?        S         0:00 nginx: worker process
 9406 ?        S         0:00 nginx: worker process
 9408 pts/0    S+        0:00 grep --color=auto nginx
```

现在我们可以看到子进程ID的变化，9403 ~ 9406。父进程 nginx: master process /usr/sbin/nginx 的ID仍然是 6670

现在是容器中实现上面的 reload 操作。

```
[root@localhost ~]# cat docker-compose.yml
version: '3.9'
services:
  nginx:
    container_name: nginx
    restart: always
    image: nginx:latest
    ports:
      - 192.168.30.11:80:80
      - 192.168.30.11:443:443
```

```
[root@localhost ~]# docker-compose up

  646 pts/0        R+          0:00 ps ax
```

## 11.5. MySQL

```
sudo mkdir -p /opt/mysql/{data,mysql.d,docker-entrypoint-initdb.d}
```

### docker-compose.yaml

```
version: '3'
```

```

services:
  mysql:
    # 镜像名
    image: mysql:latest
    # 容器名
    container_name: mysql
    # 重启策略
    restart: always
    hostname: db.netkiller.cn
    environment:
      # 时区上海
      TZ: Asia/Shanghai
      # root 密码
      MYSQL_ROOT_PASSWORD: test
      # 初始化数据库
      MYSQL_DATABASE: test
      # 初始普通化用户
      MYSQL_USER: test
      # 用户密码
      MYSQL_PASSWORD: test
      # 映射端口
    ports:
      - 3306:3306
    volumes:
      # 挂载数据
      - ./mysql/data:/var/lib/mysql/
      # 挂载配置
      - ./mysql/conf.d:/etc/mysql/conf.d/
      # 挂载初始化目录
      - ./mysql/docker-entrypoint-initdb.d:/docker-entrypoint-
initdb.d/
    command:
      --default-authentication-plugin=mysql_native_password
      --character-set-server=utf8mb4
      --collation-server=utf8mb4_general_ci
      --explicit_defaults_for_timestamp=true
      --lower_case_table_names=1

```

## 登陆测试

```

neo@MacBook-Pro-Neo ~ % docker exec -it mysql mysql -uroot -ptest

## 12. Docker FAQ

### 12.1. 检查 Docker 是否可用

```
docker -v
docker run ubuntu /bin/echo hello world
docker stop $(docker ps -a -q)
docker rm $(docker ps -a -q)
docker rmi $(docker images -q)
```

### 12.2. Bitnami

<https://github.com/bitnami>

### 12.3. 删除 <none> 镜像

```
neo@MacBook-Pro ~/git/springcloud/webflux % docker images |
grep none | cut -f2
<none>                                <none>
0fe48d3d68c6                          About an hour ago  487MB
<none>                                <none>
8372211e8f27                          About an hour ago  487MB
<none>                                <none>

# 第 2 章 Kubernetes

## 1. Minikube

### 1.1. CentOS 8 安装 minikube

#### CentOS

执行下面命令检查服务器是否开启虚拟化技术

```
egrep --color 'vmx|svm' /proc/cpuinfo
```

如果没有任何输出，请重启服务器进入 BIOS 启用 VT-X 或 AMD-v

```
curl -LO https://storage.googleapis.com/minikube/releases/latest/minikube-linux-amd64 \
  && install minikube-linux-amd64 /usr/local/bin/minikube
```

尝试运行 minikube 如果输出帮助信息表示安装成功

```
[root@localhost ~]# minikube version
minikube version: v1.13.0
commit: 0c5e9de4ca6f9c55147ae7f90af97eff5befef5f-dirty
```

```
echo "1" > /proc/sys/net/bridge/bridge-nf-call-iptables
```

dnf 安装 kubectl

```
cat <<EOF > /etc/yum.repos.d/kubernetes.repo
[kubernetes]
name=Kubernetes
baseurl=https://packages.cloud.google.com/yum/repos/kubernetes-el7-x86_64
enabled=1
gpgcheck=1
repo_gpgcheck=1
gpgkey=https://packages.cloud.google.com/yum/doc/yum-key.gpg
https://packages.cloud.google.com/yum/doc/rpm-package-key.gpg
EOF
```

```
[root@localhost ~]# dnf install kubect1
```

## 二进制安装 kubect1

```
curl -LO "https://storage.googleapis.com/kubernetes-release/release/$(curl -s  
https://storage.googleapis.com/kubernetes-release/release/stable.txt)/bin/linux/amd64/kubect1"  
\n    && install kubect1 /usr/local/bin/kubect1
```

无虚拟机

## 如果你不想安装虚拟机

```
adduser docker  
su - docker  
sudo usermod -aG docker $USER && newgrp docker
```

```
[docker@localhost ~]$ minikube start --driver=docker  
* minikube v1.13.0 on Centos 8.2.2004  
* Using the docker driver based on user configuration  
  
X Requested memory allocation (1694MB) is less than the recommended minimum 2000MB. Deployments  
may fail.  
  
X The requested memory allocation of 1694MiB does not leave room for system overhead (total  
system memory: 1694MiB). You may face stability issues.  
* Suggestion: Start minikube with less memory allocated: 'minikube start --memory=1694mb'  
  
* Starting control plane node minikube in cluster minikube  
* Pulling base image ...  
* Downloading Kubernetes v1.19.0 preload ...  
  > preloaded-images-k8s-v6-v1.19.0-docker-overlay2-amd64.tar.lz4: 486.28 MiB
```

## Mac OS

### 检查硬件是否支持虚拟化

```
iMac:Linux neo$ sysctl -a | grep -E --color 'machdep.cpu.features|VMX'  
machdep.cpu.features: FPU VME DE PSE TSC MSR PAE MCE CX8 APIC SEP MTRR PGE MCA CMOV PAT PSE36  
CLFSH DS ACPI MMX FXSR SSE SSE2 SS HTT TM PBE SSE3 PCLMULQDQ DTES64 MON DSCPL VMX SMX EST TM2  
SSSE3 CX16 TPR PDCM SSE4.1 SSE4.2 x2APIC POPCNT AES PCID XSAVE OSXSAVE TSCTMR AVX1.0
```

```
$ brew install minikube
$ brew install kubectl
$ brew install kubernetes-helm
```

```
neo@MacBook-Pro-Neo ~ % minikube start
🐹 minikube v1.13.1 on Darwin 11.0
🔔 Kubernetes 1.19.2 is now available. If you would like to upgrade, specify: --kubernetes-
version=v1.19.2
🌟 Using the hyperkit driver based on existing profile
👉 Starting control plane node minikube in cluster minikube
🔄 Restarting existing hyperkit VM for "minikube" ...
💡 This VM is having trouble accessing https://k8s.gcr.io
To pull new external images, you may need to configure a proxy:
https://minikube.sigs.k8s.io/docs/reference/networking/proxy/
🔧 Preparing Kubernetes v1.19.0 on Docker 19.03.12 ...
🔍 Verifying Kubernetes components...
🌟 Enabled addons: dashboard, default-storageclass, storage-provisioner
🏁 Done! kubectl is now configured to use "minikube" by default
```

有些老系统可能不支持 hyperkit，需要virtualbox。

```
$ brew cask install virtualbox
$ minikube start --vm-driver=virtualbox
$ minikube dashboard
```

## 1.2. Quickstart

启动

```
minikube start
```

运行一个 echoserver 镜像

```
kubectl run hello-minikube --image=k8s.gcr.io/echoserver:1.4 --port=8080
kubectl expose deployment hello-minikube --type=NodePort
minikube service hello-minikube
```

查询 echoserver 访问地址

```
minikube service hello-minikube --url
```

在浏览器中访问查询到的网址

停止并删除镜像

```
minikube stop
minikube delete
```

## 例 2.1. minikube 操作演示

快速开始使用 minikube 运行一个镜像

```
[root@localhost ~]# kubectl run hello-minikube --image=k8s.gcr.io/echoserver:1.4 --port=8080
kubectl run --generator=deployment/apps.v1 is DEPRECATED and will be removed in a future
version. Use kubectl run --generator=run-pod/v1 or kubectl create instead.
deployment.apps/hello-minikube created

[root@localhost ~]# kubectl expose deployment hello-minikube --type=NodePort
service/hello-minikube exposed

[root@localhost ~]# minikube service hello-minikube
Opening kubernetes service default/hello-minikube in default browser...

[root@localhost ~]# kubectl get pod
NAME                                READY   STATUS    RESTARTS   AGE
hello-minikube-5c856cbf98-6vfvp    1/1     Running   0           6m59s

[root@localhost ~]# minikube service hello-minikube --url
http://172.16.0.121:30436

[root@localhost ~]# curl http://172.16.0.121:30436
CLIENT VALUES:
client_address=172.17.0.1
command=GET
real path=/
query=nil
request_version=1.1
request_uri=http://172.16.0.121:8080/

SERVER VALUES:
server_version=nginx: 1.10.0 - lua: 10001

HEADERS RECEIVED:
accept=/*/*
host=172.16.0.121:30436
user-agent=curl/7.29.0
BODY:
-no body in request-
```

## 1.3. minikube 命令

```
[root@localhost ~]# minikube
Minikube is a CLI tool that provisions and manages single-node Kubernetes clusters optimized
for development workflows.

Usage:
```

```

minikube [command]

Available Commands:
  addons      Modify minikube's kubernetes addons
  cache       Add or delete an image from the local cache.
  completion  Outputs minikube shell completion for the given shell (bash or zsh)
  config      Modify minikube config
  dashboard   Access the kubernetes dashboard running within the minikube cluster
  delete      Deletes a local kubernetes cluster
  docker-env  Sets up docker env variables; similar to '$(docker-machine env)'
  help        Help about any command
  ip          Retrieves the IP address of the running cluster
  logs        Gets the logs of the running instance, used for debugging minikube, not user
code
  mount       Mounts the specified directory into minikube
  profile     Profile sets the current minikube profile
  service     Gets the kubernetes URL(s) for the specified service in your local cluster
  ssh         Log into or run a command on a machine with SSH; similar to 'docker-machine
ssh'
  ssh-key     Retrieve the ssh identity key path of the specified cluster
  start       Starts a local kubernetes cluster
  status      Gets the status of a local kubernetes cluster
  stop        Stops a running local kubernetes cluster
  tunnel      tunnel makes services of type LoadBalancer accessible on localhost
  update-check Print current and latest version number
  update-context Verify the IP address of the running cluster in kubeconfig.
  version     Print the version of minikube

Flags:
  --alsologtostderr    log to standard error as well as files
  -b, --bootstrapper string
The kubernetes cluster. (default "kubeadm")
  -h, --help            help for minikube
  --log_backtrace_at traceLocation
when logging hits line file:N, emit a stack trace
(default :0)
  --log_dir string      If non-empty, write log files in this directory
  --logtostderr          log to standard error instead of files
  -p, --profile string  The name of the minikube VM being used.
                        This can be modified to allow for multiple
minikube instances to be run independently (default "minikube")
  --stderrthreshold severity
logs at or above this threshold go to stderr (default
2)
  -v, --v Level          log level for V logs
  --vmodule moduleSpec   comma-separated list of pattern=N settings for file-
filtered logging

Use "minikube [command] --help" for more information about a command.

```

## 启动 minikube

虚拟机驱动

```
--vm-driver=none
```

```
minikube start --vm-driver=none
```

开启GPU

```
minikube start --vm-driver kvm2 --gpu
```

日志输出级别

指定日志输出级别

```
minikube start --v=7
```

CPU 和内存分配

```
minikube start --memory 8000 --cpus 2
```

指定 **kubernetes** 版本

```
minikube start --memory 8000 --cpus 2 --kubernetes-version v1.6.0
```

配置启动项

```
minikube start --extra-config=apiserver.v=10 --extra-config=kubelet.max-pods=100
```

指定 **registry-mirror** 镜像

```
minikube start --registry-mirror=https://registry.docker-cn.com

minikube start --image-mirror-country=cn --registry-mirror="https://docker.mirrors.ustc.edu.cn"
--insecure-registry="127.0.0.1:5000"

minikube start --image-mirror-country=cn --registry-mirror="https://docker.mirrors.ustc.edu.cn"
--insecure-registry="192.168.0.0/24"
```

指定下载镜像

```
minikube start --image-mirror-country=cn --image-repository=registry.cn-
hangzhou.aliyuncs.com/google_containers
```

```
# 从阿里云下载 virtualbox 镜像
minikube start --vm-driver='virtualbox' --image-mirror-country cn \
  --iso-url=https://kubernetes.oss-cn-hangzhou.aliyuncs.com/minikube/iso/minikube-v1.9.0.iso \
  --registry-mirror=https://docker.mirrors.ustc.edu.cn

minikube start --vm-driver=virtualbox \
--image-mirror-country cn \
--registry-mirror=https://docker.mirrors.ustc.edu.cn \
--image-repository=registry.aliyuncs.com/google_containers \
--insecure-registry=192.168.0.10:5000 //访问宿主机的私有docker仓库
```

### Enabling Unsafe Sysctls

```
minikube start --extra-config="kubelet.allowed-unsafe-sysctls=kernel.msg*,net.core.somaxconn".
```

### 使用 CRI-O 容易

```
minikube start --container-runtime=cri-o --vm-driver=none
```

### 启动演示

```
iMac:~ neo$ minikube start --container-runtime=cri-o
🐶 Darwin 10.13.6 上的 minikube v1.15.0
NEW Kubernetes 1.19.4 is now available. If you would like to upgrade, specify: --kubernetes-version=v1.19.4
🔧 根据现有的配置文件使用 hyperkit 驱动程序
👍 Starting control plane node minikube in cluster minikube
🔄 Restarting existing hyperkit VM for "minikube" ...
📦 正在 CRI-O 1.17.3 中准备 Kubernetes v1.19.2...
🔗 Configuring bridge CNI (Container Networking Interface) ...
🔍 Verifying Kubernetes components...
🌟 Enabled addons: storage-provisioner, dashboard, default-storageclass
🎉 Done! kubectl is now configured to use "minikube" cluster and "" namespace by default
```

### 停止 minikube

```
[root@localhost ~]# minikube stop
Stopping local Kubernetes cluster...
Machine stopped.
```

### Docker 环境变量

```
neo@MacBook-Pro-Neo ~ % minikube docker-env
export DOCKER_TLS_VERIFY="1"
export DOCKER_HOST="tcp://192.168.64.3:2376"
export DOCKER_CERT_PATH="/Users/neo/.minikube/certs"
export MINIKUBE_ACTIVE_DOCKERD="minikube"

# To point your shell to minikube's docker-daemon, run:
# eval $(minikube -p minikube docker-env)
```

## 设置环境变量

```
# eval $(minikube docker-env)
# eval $(minikube -p minikube docker-env)
```

## SSH

```
neo@MacBook-Pro-Neo ~ % minikube ssh
```

## 缓存镜像

```
# cache a image into $HOME/.minikube/cache/images

$ minikube cache add ubuntu:16.04
$ minikube cache add redis:3

# list cached images
$ minikube cache list
redis:3
ubuntu:16.04

# delete cached images
$ minikube cache delete ubuntu:16.04
$ minikube cache delete $(minikube cache list)
```

## 清理 minikube

```
minikube delete
```

```
rm ~/.minikube  
minikube start
```

## Kubernetes 控制面板

Dashboard是基于Web的Kubernetes管理界面。使用下面的命令启动：

```
minikube dashboard
```

查询控制面板访问地址

```
$ minikube dashboard --url  
http://192.168.3.14:30000
```

## service

```
[root@localhost ~]# minikube service hello-minikube --url  
http://172.16.0.121:30436
```

## 查看日志

```
minikube logs -v10
```

## 查看 Docker 环境变量

```
minikube docker-env
```

## profile

```
minikube profile demo  
minikube start -p demo --memory=8192 --cpus=6 --disk-size=50g
```

## addons

查看所有插件

iMac:registry neo\$ minikube addons list

| ADDON NAME                  | PROFILE  | STATUS   |
|-----------------------------|----------|--|
| ambassador                  | minikube | disabled   |
| dashboard                   | minikube | enabled   |
| default-storageclass        | minikube | enabled   |
| efk                         | minikube | disabled   |
| freshpod                    | minikube | disabled   |
| gcp-auth                    | minikube | disabled   |
| gvisor                      | minikube | disabled   |
| helm-tiller                 | minikube | disabled   |
| ingress                     | minikube | disabled   |
| ingress-dns                 | minikube | disabled   |
| istio                       | minikube | disabled   |
| istio-provisioner           | minikube | disabled   |
| kubevirt                    | minikube | disabled   |
| logviewer                   | minikube | disabled   |
| metallb                     | minikube | disabled   |
| metrics-server              | minikube | disabled   |
| nvidia-driver-installer     | minikube | disabled   |
| nvidia-gpu-device-plugin    | minikube | disabled   |
| olm                         | minikube | disabled   |
| pod-security-policy         | minikube | disabled   |
| registry                    | minikube | disabled   |
| registry-aliases            | minikube | disabled   |
| registry-creds              | minikube | disabled   |
| storage-provisioner         | minikube | enabled  |
| storage-provisioner-gluster | minikube | disabled   |

启用 addons

```
minikube addons enable heapster
minikube addons enable ingress
```

启用 WebUI

```
[root@localhost ~]# minikube addons enable dashboard
dashboard was successfully enabled
[root@localhost ~]# minikube addons list | grep dashboard
- dashboard: enabled
```

查看 addons 列表

```
[root@localhost ~]# minikube addons list
- addon-manager: enabled
- dashboard: enabled
- default-storageclass: enabled
```

```
- efk: disabled
- freshpod: disabled
- gvisor: disabled
- heapster: disabled
- ingress: disabled
- kube-dns: disabled
- metrics-server: disabled
- nvidia-driver-installer: disabled
- nvidia-gpu-device-plugin: disabled
- registry: disabled
- registry-creds: disabled
- storage-provisioner: enabled
- storage-provisioner-gluster: disabled
```

开启 **registry** 私有库

```
# enable the registry addon
$ minikube addons enable registry

$ minikube start

# use the minikube docker daemon from the host
$ eval $(minikube docker-env)

# get the ip of the registry endpoint
$ kubectl -n kube-system get svc registry -o jsonpath="{.spec.clusterIP}"
10.0.0.240
```

```
{
  "insecure-registries" : ["10.0.0.240"]
}
```

```
$ minikube ssh
$ docker pull busybox
$ docker tag busybox 10.0.0.240/busybox

# or

# build and push to insecure registry
$ docker build -t 10.0.0.240/busybox .
$ docker push 10.0.0.240/busybox
```

启用 **ingress**

```
iMac:kubernetes neo$ minikube addons enable ingress
```

**SSH**

--vm-driver=none 不支持 ssh

```
[root@localhost ~]# minikube ssh
'none' driver does not support 'minikube ssh' command
```

## 查看IP地址

```
[root@localhost ~]# minikube ip
172.16.0.121
```

## 镜像管理

```
neo@MacBook-Pro-Neo ~ % minikube image ls
registry.cn-hangzhou.aliyuncs.com/google_containers/storage-provisioner:v5
registry.cn-hangzhou.aliyuncs.com/google_containers/pause:3.2
registry.cn-hangzhou.aliyuncs.com/google_containers/metrics-scraper:v1.0.4
registry.cn-hangzhou.aliyuncs.com/google_containers/kube-scheduler:v1.20.7
registry.cn-hangzhou.aliyuncs.com/google_containers/kube-proxy:v1.20.7
registry.cn-hangzhou.aliyuncs.com/google_containers/kube-controller-manager:v1.20.7
registry.cn-hangzhou.aliyuncs.com/google_containers/kube-apiserver:v1.20.7
registry.cn-hangzhou.aliyuncs.com/google_containers/etcd:3.4.13-0
registry.cn-hangzhou.aliyuncs.com/google_containers/dashboard:v2.1.0
registry.cn-hangzhou.aliyuncs.com/google_containers/coredns:1.7.0
docker.io/netkiller/flask:latest
```

## 1.4. FAQ

**This computer doesn't have VT-X/AMD-v enabled. Enabling it in the BIOS is mandatory**

检查一下 BIOS 是否开启 VT-X/AMD-v

如果在虚拟机安装 Minikube 也会遇到这个问题。 可以使用 --vm-driver=none 参数启动。

```
neo@ubuntu:~$ sudo minikube start --vm-driver=none
```

**ERROR FileContent--proc-sys-net-bridge-bridge-nf-call-iptables**

解决方法

```
echo "1" > /proc/sys/net/bridge/bridge-nf-call-iptables
```

然后在 minikube start

## ERROR ImagePull

[ERROR ImagePull]: failed to pull image k8s.gcr.io/pause:3.1: output: 3.1: Pulling from pause Get https://k8s.gcr.io/v2/pause/manifests/sha256:59eec8837a4d942cc19a52b8c09ea75121acc38114a2c68b98983ce9356b8610: net/http: TLS handshake timeout

更换镜像再重试

```
[root@localhost ~]# minikube start --vm-driver=none --registry-mirror=https://registry.docker-cn.com
```

## 证书已存在错误

启动提示如下错误，一般出现这种错误是因为 minikube stop, minikube delete 后再重启 minikube start

```
error execution phase kubeconfig/admin: a kubeconfig file "/etc/kubernetes/admin.conf" exists already but has got the wrong CA cert
error execution phase kubeconfig/kubelet: a kubeconfig file "/etc/kubernetes/kubelet.conf" exists already but has got the wrong CA cert
error execution phase kubeconfig/controller-manager: a kubeconfig file "/etc/kubernetes/controller-manager.conf" exists already but has got the wrong CA cert
error execution phase kubeconfig/scheduler: a kubeconfig file "/etc/kubernetes/scheduler.conf" exists already but has got the wrong CA cert
```

## 解决方法

```
[root@localhost ~]# mv /etc/kubernetes/admin.conf /etc/kubernetes/admin.conf.backup
[root@localhost ~]# mv /etc/kubernetes/kubelet.conf /etc/kubernetes/kubelet.conf.backup
[root@localhost ~]# mv /etc/kubernetes/controller-manager.conf /etc/kubernetes/controller-manager.conf.backup
[root@localhost ~]# mv /etc/kubernetes/scheduler.conf /etc/kubernetes/scheduler.conf.backup
```

现在启动 minikube start 不会再出错

```
[root@localhost ~]# minikube start --vm-driver=none
Starting local Kubernetes v1.13.2 cluster...
Starting VM...
Getting VM IP address...
Moving files into cluster...
Setting up certs...
Connecting to cluster...
Setting up kubeconfig...
Stopping extra container runtimes...
Starting cluster components...
Verifying kubelet health ...
Verifying apiserver health ...
```

```
Kubectl is now configured to use the cluster.
=====
WARNING: IT IS RECOMMENDED NOT TO RUN THE NONE DRIVER ON PERSONAL WORKSTATIONS
        The 'none' driver will run an insecure kubernetes apiserver as root that may leave the
host vulnerable to CSRF attacks

When using the none driver, the kubectl config and credentials generated will be root owned and
will appear in the root home directory.
You will need to move the files to the appropriate location and then set the correct
permissions. An example of this is below:

        sudo mv /root/.kube $HOME/.kube # this will write over any previous configuration
        sudo chown -R $USER $HOME/.kube
        sudo chgrp -R $USER $HOME/.kube

        sudo mv /root/.minikube $HOME/.minikube # this will write over any previous
configuration
        sudo chown -R $USER $HOME/.minikube
        sudo chgrp -R $USER $HOME/.minikube

This can also be done automatically by setting the env var CHANGE_MINIKUBE_NONE_USER=true
Loading cached images from config file.

Everything looks great. Please enjoy minikube!
```

#### http: server gave HTTP response to HTTPS client

问题原因，使用私有 registry 由于没有 HTTPS 导致 kubectl 使用 https 去访问私有 registry.

```
Failed to pull image "192.168.3.85:5000/netkiller/config:latest": rpc error: code = Unknown
desc = Error response from daemon: Get https://192.168.3.85:5000/v2/: http: server gave HTTP
response to HTTPS client
```

minikube 并不会使用 docker 配置文件中的 insecure-registry 配置项

解决办法

```
minikube start --insecure-registry=127.0.0.1:5000
```

或指定网段

```
minikube start --insecure-registry "10.0.0.0/24"
```

#### provided port is not in the valid range. The range of valid ports is 30000-32767

```
iMac:kubernetes neo$ kubectl create -f redis/redis.yml
```

```
configmap/redis-config created
deployment.apps/redis created
The Service "redis" is invalid: spec.ports[0].nodePort: Invalid value: 6379: provided port is not in the valid range. The range of valid ports is 30000-32767
```

编辑kube-apiserver.yaml文件

```
$ minikube ssh
$ sudo vi /etc/kubernetes/manifests/kube-apiserver.yaml
```

增加kube-apiserver的启动配置项

```
--service-node-port-range=1024-65535
```

```
$ sudo cat /etc/kubernetes/manifests/kube-apiserver.yaml
apiVersion: v1
kind: Pod
metadata:
  annotations:
    kubeadm.kubernetes.io/kube-apiserver.advertise-address.endpoint: 192.168.64.5:8443
  creationTimestamp: null
  labels:
    component: kube-apiserver
    tier: control-plane
  name: kube-apiserver
  namespace: kube-system
spec:
  containers:
  - command:
    - kube-apiserver
    - --advertise-address=192.168.64.5
    - --allow-privileged=true
    - --authorization-mode=Node,RBAC
    - --client-ca-file=/var/lib/minikube/certs/ca.crt
    - --enable-admission-
plugins=NamespaceLifecycle,LimitRanger,ServiceAccount,DefaultStorageClass,DefaultTolerationSeco
nds,NodeRestriction,MutatingAdmissionWebhook,ValidatingAdmissionWebhook,ResourceQuota
    - --enable-bootstrap-token-auth=true
    - --etcd-cafile=/var/lib/minikube/certs/etcd/ca.crt

## 2. microk8s

<https://microk8s.io>

更多配置参考官网 <https://github.com/ubuntu/microk8s>

### 2.1. 安装 microk8s

```
snap install kubectl --classic  
snap install microk8s --channel=1.14/beta --classic
```

安装 VirtualBox

```
neo@ubuntu:~$ sudo apt install -y virtualbox
```

启用或禁用 microk8s

```
snap disable microk8s    # 禁用  
snap enable microk8s     # 启用
```

卸载

```
microk8s.reset  
snap remove microk8s
```

## 2.2. kubectl

为了不和已经安装的 kubectl 产生冲突，microk8s 有自己的 microk8s.kubectl 命令

```
microk8s.kubectl get services
```

如果本地没有 kubectl 命令可以增加一个别名

```
snap alias microk8s.kubectl kubectl
```

取消别名

```
snap unalias kubectl
```

API 服务监听 8080 端口

```
microk8s.kubectl config view
```

## 2.3. Kubernetes Addons

microk8s 只是最精简的安装，所以只有 api-server, controller-manager, scheduler, kubelet, cni, kube-proxy 被安装运行。额外的服务比如 kube-dns, dashboard 可以通过 microk8s.enable 启动

## 可用的扩展

```
dns  
dashboard  
storage  
ingress  
gpu  
istio  
registry  
metrics-server
```

### dashboard

```
microk8s.enable dns dashboard  
禁用  
microk8s.disable dns dashboard
```

### 3. kubectl - controls the Kubernetes cluster manager.

kubectl是Kubernetes的命令行管理工具

kubectl controls the Kubernetes cluster manager.

Find more information at: <https://kubernetes.io/docs/reference/kubectl/overview/>

#### Basic Commands (Beginner):

|        |   |
|--------|---|
| create | Create a resource from a file or from stdin.  |
| expose | Take a replication controller, service, deployment or pod and expose it as a new Kubernetes Service |
| run    | Run a particular image on the cluster   |
| set    | Set specific features on objects  |

#### Basic Commands (Intermediate):

|         |   |
|---------|---|
| explain | Documentation of resources  |
| get     | Display one or many resources   |
| edit    | Edit a resource on the server   |
| delete  | Delete resources by filenames, stdin, resources and names, or by resources and label selector |

#### Deploy Commands:

|           |   |
|-----------|---|
| rollout   | Manage the rollout of a resource  |
| scale     | Set a new size for a Deployment, ReplicaSet, Replication Controller, or Job |
| autoscale | Auto-scale a Deployment, ReplicaSet, or ReplicationController               |

#### Cluster Management Commands:

|              |  |
|--------------|--|
| certificate  | Modify certificate resources.                |
| cluster-info | Display cluster info                         |
| top          | Display Resource (CPU/Memory/Storage) usage. |
| cordons      | Mark node as unschedulable                   |
| uncordon     | Mark node as schedulable                     |
| drain        | Drain node in preparation for maintenance    |
| taint        | Update the taints on one or more nodes       |

#### Troubleshooting and Debugging Commands:

|              |   |
|--------------|---|
| describe     | Show details of a specific resource or group of resources |
| logs         | Print the logs for a container in a pod                   |
| attach       | Attach to a running container                             |
| exec         | Execute a command in a container                          |
| port-forward | Forward one or more local ports to a pod                  |
| proxy        | Run a proxy to the Kubernetes API server                  |
| cp           | Copy files and directories to and from containers.        |
| auth         | Inspect authorization                                     |

#### Advanced Commands:

|         |   |
|---------|---|
| diff    | Diff live version against would-be applied version                    |
| apply   | Apply a configuration to a resource by filename or stdin              |
| patch   | Update field(s) of a resource using strategic merge patch             |
| replace | Replace a resource by filename or stdin                               |
| wait    | Experimental: Wait for a specific condition on one or many resources. |
| convert | Convert config files between different API versions                   |

#### Settings Commands:

|            |  |
|------------|--|
| label      | Update the labels on a resource                                    |
| annotate   | Update the annotations on a resource                               |
| completion | Output shell completion code for the specified shell (bash or zsh) |

#### Other Commands:

|               |  |
|---------------|--|
| api-resources | Print the supported API resources on the server                                |
| api-versions  | Print the supported API versions on the server, in the form of "group/version" |
| config        | Modify kubeconfig files  |

```
plugin      Provides utilities for interacting with plugins.
version     Print the client and server version information
```

Usage:

```
kubectl [flags] [options]
```

Use "kubectl <command> --help" for more information about a given command.

Use "kubectl options" for a list of global command-line options (applies to all commands).

### 3.1. 如何从 docker 过渡到 kubectl 命令

docker run 命令

```
$ docker run -d --restart=always -e DOMAIN=cluster --name nginx -p 80:80 nginx
```

kubectl 命令

```
$ kubectl run --image=nginx nginx-app --port=80 --env="DOMAIN=cluster"
$ kubectl expose deployment nginx-app --port=80 --name=nginx-http
```

docker exec 命令

```
$ docker run -t -i ubuntu:14.10 /bin/bash
```

kubectl 命令

```
$ kubectl exec -ti nginx-app-5jyvm -- /bin/sh
```

docker ps 命令

```
$ docker ps
```

kubectl 命令

```
$ kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
mongodba-6d5d6ddf64-jw4fv          1/1     Running   0           16h

# kubectl exec -it mongodba-6d5d6ddf64-jw4fv bash
```

## 3.2. 查看信息

### api-versions

```
iMac:springboot neo$ kubectl api-versions

storage.k8s.io/v1beta1
v1
```

### 节点

```
[root@localhost ~]# kubectl get nodes
NAME          STATUS    ROLES    AGE   VERSION
minikube      Ready     master   23m   v1.13.2
```

### nodes

```
[root@localhost ~]# kubectl get nodes
```

| NAME     | STATUS | ROLES  | AGE  | VERSION |
|----------|--------|--------|------|---------|
| minikube | Ready  | master | 119m | v1.13.2 |

```
iMac:~ neo$ kubectl get node
NAME          STATUS    ROLES    AGE      VERSION
minikube      Ready     master   42h      v1.19.0

iMac:~ neo$ kubectl get node -o wide
NAME          STATUS    ROLES    AGE      VERSION    INTERNAL-IP    EXTERNAL-IP    OS-IMAGE
KERNEL-VERSION  CONTAINER-RUNTIME
minikube      Ready     master   42h      v1.19.0    192.168.64.2   <none>         Buildroot 2019.02.11
4.19.114      docker://19.3.12
```

## 查询集群状态

```
[root@localhost ~]# kubectl get cs
NAME                        STATUS    MESSAGE           ERROR
controller-manager        Healthy   ok
scheduler                 Healthy   ok
etcd-0                    Healthy   {"health": "true"}
```

## config

```
[root@localhost ~]# kubectl config view
apiVersion: v1
clusters:
- cluster:
    certificate-authority: /root/.minikube/ca.crt
    server: https://172.16.0.121:8443
    name: minikube
contexts:
- context:
    cluster: minikube
    user: minikube
    name: minikube
current-context: minikube
kind: Config
preferences: {}
users:
- name: minikube
  user:
    client-certificate: /root/.minikube/client.crt
    client-key: /root/.minikube/client.key
```

```
iMac:~ neo$ kubectl config view
apiVersion: v1
clusters:
- cluster:
    certificate-authority-data: DATA+OMITTED
```

```

    server: https://kubernetes.docker.internal:6443
    name: docker-desktop
- cluster:
    certificate-authority: /Users/neo/.minikube/ca.crt
    server: https://192.168.64.2:8443
    name: minikube
contexts:
- context:
    cluster: docker-desktop
    user: docker-desktop
    name: docker-desktop
- context:
    cluster: minikube
    user: minikube
    name: minikube
current-context: minikube
kind: Config
preferences: {}
users:
- name: docker-desktop
  user:
    client-certificate-data: REDACTED
    client-key-data: REDACTED
- name: minikube
  user:
    client-certificate: /Users/neo/.minikube/profiles/minikube/client.crt
    client-key: /Users/neo/.minikube/profiles/minikube/client.key

```

#### use-context

如果之前用其他方式运行Kubernetes，如 minikube, mircok8s 等等，可以使用下面命令切换。

```
$ kubectl config use-context docker-for-desktop
```

#### cluster-info

```

[root@localhost ~]# kubectl cluster-info
Kubernetes master is running at https://172.16.0.121:8443
KubeDNS is running at https://172.16.0.121:8443/api/v1/namespaces/kube-system/services/kube-dns:dns/proxy

To further debug and diagnose cluster problems, use 'kubectl cluster-info dump'.

```

### 3.3. namespace 命名空间

```
$ kubectl create namespace new-namespace
```

### 3.4. label 标签

label 用于识别对象，管理关联关系等目的，如Pod、Service、Deployment、Node的关联。

```
kubectl label nodes <node-name> <label-key>=<label-value>
```

### 3.5. pods

```
kubectl get pod <pod-name> -o wide
kubectl get pods --all-namespaces
```

#### 查看所有POD

```
[root@localhost ~]# kubectl get pods --all-namespaces
```

| NAMESPACE   | NAME                                 | READY | STATUS  | RESTARTS | AGE   |
|-------------|--------------------------------------|-------|---------|----------|-------|
| default     | hello-minikube-5c856cbf98-6vfvp      | 1/1   | Running | 1        | 4d18h |
| kube-system | coredns-86c58d9df4-2rfqf             | 1/1   | Running | 51       | 4d18h |
| kube-system | coredns-86c58d9df4-wkb7l             | 1/1   | Running | 49       | 4d18h |
| kube-system | etcd-minikube                        | 1/1   | Running | 12       | 4d18h |
| kube-system | kube-addon-manager-minikube          | 1/1   | Running | 11       | 4d18h |
| kube-system | kube-apiserver-minikube              | 1/1   | Running | 74       | 4d18h |
| kube-system | kube-controller-manager-minikube     | 1/1   | Running | 31       | 4d18h |
| kube-system | kube-proxy-brrdd                     | 1/1   | Running | 1        | 4d18h |
| kube-system | kube-scheduler-minikube              | 1/1   | Running | 31       | 4d18h |
| kube-system | kubernetes-dashboard-ccc79bfc9-dxcq2 | 1/1   | Running | 7        | 4d17h |
| kube-system | storage-provisioner                  | 1/1   | Running | 2        | 4d18h |

```
iMac:~ neo$ kubectl get pods --output=wide
```

| NAME                      | NOMINATED NODE | READY | STATUS           | RESTARTS | AGE | IP         | NODE     |
|---------------------------|----------------|-------|------------------|----------|-----|------------|----------|
| registry-65854b565b-bkhvq |                | 0/1   | ImagePullBackOff | 0        | 18m | 172.17.0.4 | minikube |
| <none>                    | <none>         |       |                  |          |     |            |          |

#### 查看pod标签

```
kubectl get pods --show-labels
```

#### 查看指定标签的pod

```
kubectl get pods -l run=nginx
```

#### 运行 POD

```
iMac:kubernetes neo$ kubectl run registry --image=registry:latest
```

```
kubectl run busybox --image=busybox --command -- ping www.netkiller.cn
```

```
kubectl run nginx --replicas=3 --labels="app=example" --image=nginx:latest --port=80
```

```
kubectl run busybox --rm=true --image=busybox --restart=Never -it
```

## pod

```
[root@localhost ~]# kubectl get pod
NAME                                READY   STATUS    RESTARTS   AGE
hello-minikube-5c856cbf98-6vfvp    1/1     Running   0           6m59s
```

### 指定命名空间

```
[root@localhost ~]# kubectl get pod --namespace=kube-system
NAME                                READY   STATUS    RESTARTS   AGE
coredns-86c58d9df4-2rfqf           1/1     Running   0           40m
coredns-86c58d9df4-wkb7l           1/1     Running   0           40m
etcd-minikube                       1/1     Running   0           40m
kube-addon-manager-minikube         1/1     Running   0           41m
kube-apiserver-minikube             1/1     Running   2           40m
kube-controller-manager-minikube    1/1     Running   6           40m
kube-proxy-brrdd                   1/1     Running   0           40m
kube-scheduler-minikube             1/1     Running   5           41m
kubernetes-dashboard-ccc79bfc9-dxcq2 1/1     Running   5           16m
storage-provisioner                 1/1     Running   0           39m
```

## 删除 pod

```
kubectl delete -n default pod registry
kubectl delete -n default pod counter
```

## 查看 Pod 的事件

```
kubectl describe pod <pod-name>
```

```
iMac:~ neo$ kubectl describe pod springboot
Name:          springboot

## Taint（污点）和 Toleration（容忍）

其目的是分配 pod 在集群间的调度，Taint 和 toleration 相互配合，可以用来避免 pod 被分配到某个节点上。这跟节点亲和性作用相反。

给 node 节点设置 label，通过给 pod 设置 nodeSelector 将 pod 调度到匹配标签的节点上。

如果设置 toleration 应用于 pod 上，则表示 pod 可以被调度到 taint 的节点上。

#### Taint (污点) 设置

设置污点: `kubectl taint node [node] key=value:[effect]`

#### effect 参数

- 1.NoSchedule：不能被调度。
- 2.PreferNoSchedule：尽量不要调度。
- 3.NoExecute：不允许该节点有 Pod。

在 shenzhen 节点上设置Taint，键为key，值为value，effect是NoSchedule。

```
kubectl taint nodes shenzhen key=value:NoSchedule
```

这意味着除非pod只有明确声明toleration可以容忍这个Taint，否则就不会被调度到该节点。

```
apiVersion: v1
kind: Pod
metadata:
  name: pod-taints
spec:
  tolerations:
    - key: "key"
      operator: "Equal"
      value: "value"
      effect: "NoSchedule"
  containers:
    - name: pod-taints
      image: busybox:latest
```

#### Toleration (容忍) 调度

key 存在即可匹配

```
spec:
  tolerations:
    - key: "key"
      operator: "Exists"
      effect: "NoSchedule"
```

key 必须存在，并且值等 value

```
spec:
  tolerations:
    - key: "key"
      operator: "Equal"
      value: "value"
```

```
effect: "NoSchedule"
```

在pod上设置多个toleration:

```
spec:
  tolerations:
  - key: "key1"
    operator: "Equal"
    value: "value1"
    effect: "NoSchedule"
  - key: "key2"
    operator: "Equal"
    value: "value2"
    effect: "NoExecute"
```

如果给node加上Taint effect=NoExecute的, 该节点上的没有设置toleration的pod都会被立刻驱逐, 设置tolerationSeconds 后会给 Pod 一个宽限期。

```
spec:
  tolerations:
  - key: "key"
    operator: "Equal"
    value: "value"
    effect: "NoSchedule"
    tolerationSeconds: 3600
```

使用场景

例如有些节点上挂了SSD, 给redis,mongodb,mysql 使用, 有些节点上安装了显卡GPU。就可以使用 taint

```
kubectl taint nodes shenzhen special=true:NoSchedule
kubectl taint nodes guangdong special=true:PreferNoSchedule
```

### 3.6. expose

```
kubectl expose deployment nginx --port=88 --target-port=80 --type=NodePort --name=nginx-service
kubectl describe service nginx-service
```

将服务暴露出去, 在服务前面加一个负载均衡, 因为pod可能分布在不同的结点上。

- port: 暴露出去的端口
- type=NodePort: 使用结点+端口方式访问服务
- target-port: 容器的端口
- name: 创建service指定的名称

```
kubectl expose deployment nginx --port=80 --target-port=8080 --type=NodePort
kubectl expose deployment nginx --port=80 --target-port=8080 --type=LoadBalancer
```

### 3.7. 服务管理

#### 列出服务

```
[root@localhost ~]# kubectl get service
```

| NAME           | TYPE      | CLUSTER-IP   | EXTERNAL-IP | PORT(S)        | AGE  |
|----------------|-----------|--------------|-------------|----------------|------|
| hello-minikube | NodePort  | 10.109.33.86 | <none>      | 8080:30436/TCP | 134m |
| kubernetes     | ClusterIP | 10.96.0.1    | <none>      | 443/TCP        | 147m |

#### 排序

```
iMac:kubernetes neo$ kubectl get services --sort-by=.metadata.name
```

| NAME       | TYPE      | CLUSTER-IP     | EXTERNAL-IP | PORT(S)        | AGE   |
|------------|-----------|----------------|-------------|----------------|-------|
| kubernetes | ClusterIP | 10.96.0.1      | <none>      | 443/TCP        | 121m  |
| my-service | ClusterIP | 10.106.157.143 | <none>      | 80/TCP,443/TCP | 9m43s |

#### 查看服务详细信息

```
iMac:kubernetes neo$ kubectl describe service/registry
```

Name: registry  
Namespace: default  
Labels: app=registry  
Annotations: <none>  
Selector: app=registry  
Type: NodePort  
IP: 10.10.0.188  
Port: registry 5000/TCP  
TargetPort: 5000/TCP  
NodePort: registry 32050/TCP  
Endpoints: 172.17.0.6:5000  
Session Affinity: None  
External Traffic Policy: Cluster  
Events: <none>

#### 更新服务

```
kubectl replace -f service.yaml --force
```

## 删除服务

```
kubectl delete service hello-minikube
```

## clusterip

### 语法

```
$ kubectl create service clusterip NAME [--tcp=<port>:<targetPort>] [--dry-run]
```

### 演示

```
kubectl create service clusterip my-service --tcp=5678:8080
```

### headless 模式

```
kubectl create service clusterip my-service --clusterip="None"
```

## externalname

### 语法

```
$ kubectl create service externalname NAME --external-name external.name [--dry-run]
```

### 演示

```
kubectl create service externalname my-externalname --external-name bar.com
```

## loadbalancer

### 语法

```
$ kubectl create service loadbalancer NAME [--tcp=port:targetPort] [--dry-run]
```

演示

```
kubectl create service loadbalancer my-lb --tcp=5678:8080
```

## nodeport

语法

```
$ kubectl create service nodeport NAME [--tcp=port:targetPort] [--dry-run]
```

演示

```
kubectl create service nodeport my-nodeport --tcp=5678:8080
```

## serviceaccount

语法

```
$ kubectl create serviceaccount NAME [--dry-run]
```

演示

```
kubectl create serviceaccount my-service-account
```

## 3.8. 部署管理

```
kubectl create -f  
https://raw.githubusercontent.com/kubernetes/dashboard/master/src/deploy/recommended/kubernetes-  
dashboard.yaml  
kubectl get pods --namespace=kube-system
```

```
kubectl create deployment registry --image=registry:latest  
kubectl get deploy
```

## 删除 deployment

```
kubectl delete deployment hello-minikube
```

## 3.9. 资源管理

```
kubectl scale -n default deployment nginx --replicas=1
kubectl scale deployment springbootdemo --replicas=4
kubectl scale deployment nginx --replicas=10
```

## 3.10. 查看 pod 日志

```
kubectl logs <pod-name>
kubectl logs --previous <pod-name>
```

## 3.11. 执行 Shell

进入容器内部.

```
$ kubectl get pods
NAME                                READY   STATUS    RESTARTS   AGE
mongodba-6d5d6ddf64-jw4fv          1/1     Running   0           16h

$ kubectl exec -it mongodba-6d5d6ddf64-jw4fv bash
```

```
kubectl run busybox --image=busybox:latest

iMac:kubernetes neo$ kubectl exec -it busybox -- nslookup www.netkiller.cn
Server:          10.10.0.10
Address:         10.10.0.10:53

Non-authoritative answer:
www.netkiller.cn    canonical name = netkiller.github.io
Name:   netkiller.github.io
Address: 185.199.110.153
Name:   netkiller.github.io
Address: 185.199.108.153
Name:   netkiller.github.io
Address: 185.199.111.153
Name:   netkiller.github.io
Address: 185.199.109.153

*** Can't find www.netkiller.cn: No answer
```

### 3.12. edit

```
kubectl edit --namespace=kube-system rc kubernetes-dashboard
```

### 3.13. rollout

查看发布历史

```
kubectl rollout history deployment/nginx
```

指定版本号

```
kubectl rollout history deployment/nginx --revision=3
```

查看部署状态

```
kubectl rollout status deployment/nginx
```

回滚到上一个版本

```
kubectl rollout undo deployment/nginx-deployment
```

回滚到指定版本

```
kubectl rollout undo deployment/nginx-deployment --to-revision=3
```

### 3.14. port-forward 端口映射

```
$ kubectl port-forward svc/demo 8080:8080
```

### 3.15. secret 密钥管理

```
$ cat <<EOF | kubectl create -f -
apiVersion: v1
kind: Secret
metadata:
  name: mysecret
type: Opaque
data:
  password: $(echo "passwd" | base64)
  username: $(echo "neo" | base64)
EOF
```

## Private Registry 用户认证

```
kubectl create secret docker-registry docker-hub \
--docker-server=https://index.docker.io/v1/ \
--docker-username=netkiller \
--docker-password=password \
--docker-email=netkiller@msn.com
```

```
iMac:~spring neo$ kubectl get secret
NAME                                TYPE                                DATA  AGE
default-token-fhfn8                 kubernetes.io/service-account-token 3      2d23h
docker-hub                          kubernetes.io/dockerconfigjson      1      15s
```

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: springboot
spec:
  replicas: 3
  selector:
    matchLabels:
      app: springboot
  template:
    metadata:
      labels:
        app: springboot
    spec:
      containers:
        - name: springboot
          image: netkiller/config:latest
          imagePullPolicy: IfNotPresent
          ports:
            - containerPort: 8888
          imagePullSecrets:
            - name: docker-hub
```

```
kubectl delete -n default secret docker-hub
```

## 配置TLS SSL

```
# 证书生成
mkdir cert && cd cert

# 生成 CA 自签证书

openssl genrsa -out ca-key.pem 2048
openssl req -x509 -new -nodes -key ca-key.pem -days 10000 -out ca.pem -subj "/CN=kube-ca"

# 编辑 openssl 配置
cp /etc/pki/tls/openssl.cnf .
vim openssl.cnf

[req]
req_extensions = v3_req # 注释删掉
# 新增下面配置是
[ v3_req ]
basicConstraints = CA:FALSE
keyUsage = nonRepudiation, digitalSignature, keyEncipherment
subjectAltName = @alt_names
[alt_names]
DNS.1 = ns.netkiller.cn

# 生成证书
openssl genrsa -out ingress-key.pem 2048
openssl req -new -key ingress-key.pem -out ingress.csr -subj "/CN=www.netkiller.cn" -config
openssl.cnf
openssl x509 -req -in ingress.csr -CA ca.pem -CAkey ca-key.pem -CAcreateserial -out ingress.pem
-days 365 -extensions v3_req -extfile openssl.cnf
```

```
kubectl create secret tls ingress-secret --namespace=kube-system --key cert/ingress-key.pem --
cert cert/ingress.pem
```

## 3.16. ConfigMap

ConfigMap 用于保存配置数据的键值，也可以用来保存配置文件。

### 创建 Key-Value 配置项

从key-value字符串创建ConfigMap

```
neo@MacBook-Pro-Neo ~ % kubectl create configmap config --from-literal=nickname=netkiller
configmap/config created
```

```
neo@MacBook-Pro-Neo ~ % kubectl get configmap config -o go-template='{{.data}}'
map[nickname:netkiller]
```

## 创建多个KV对

```
neo@MacBook-Pro-Neo ~ % kubectl create configmap user --from-literal=username=neo --from-literal=nickname=netkiller --from-literal=age=35
configmap/user created

neo@MacBook-Pro-Neo ~ % kubectl get configmap user -o go-template='{{.data}}'
map[age:35 nickname:netkiller username:neo]
```

```
neo@MacBook-Pro-Neo ~ % kubectl create configmap db-config --from-literal=db.host=172.16.0.10 --from-literal=db.port='3306'
configmap/db-config created
neo@MacBook-Pro-Neo ~ % kubectl describe configmap db-config
Name:          db-config
Namespace:     default
Labels:        <none>
Annotations:   <none>

Data
====
db.port:
----
3306
db.host:
----
172.16.0.10
Events:      <none>
```

## 从文件创建 ConfigMap

```
neo@MacBook-Pro-Neo ~ % kubectl create configmap passwd --from-file=/etc/passwd
configmap/passwd created

neo@MacBook-Pro-Neo ~ % kubectl describe configmap passwd
Name:          passwd
Namespace:     default
Labels:        <none>
Annotations:   <none>

Data
====
passwd:
----

```

## 处理多个文件

```

neo@MacBook-Pro-Neo ~ % kubectl create configmap apache-httpd --from-
file=/etc/apache2/httpd.conf --from-file=/etc/apache2/extra/httpd-vhosts.conf
configmap/apache-httpd created

```

## 处理目录内的所有文件

```

neo@MacBook-Pro-Neo ~ % kubectl create configmap apache-httpd-users --from-
file=/etc/apache2/users
configmap/apache-httpd-users created

```

```
cat <<EOF > /tmp/test.env
username=neo
nickname=netkiller
age=38
sex=Y
EOF
```

```
neo@MacBook-Pro-Neo ~ % cat <<EOF > /tmp/test.env
username=neo
nickname=netkiller
age=38
sex=Y
EOF
neo@MacBook-Pro-Neo ~ % cat /tmp/test.env
username=neo
nickname=netkiller
age=38
sex=Y
neo@MacBook-Pro-Neo ~ % kubectl create configmap env-config --from-env-file=/tmp/test.env
configmap/env-config created
```

## 查看 ConfigMap

```
neo@MacBook-Pro-Neo ~ % kubectl get configmap
NAME      DATA  AGE

```

## 3.17. Job/CronJob

### CronJob

```
kubectl run hello --schedule="*/1 * * * *" --restart=OnFailure --image=busybox -- /bin/sh -c
"date; echo Hello from the Kubernetes cluster"

kubectl delete cronjob hello
```

## 3.18. explain

### ingress

```
iMac:kubernetes neo$ kubectl explain ingress
KIND:      Ingress
VERSION:   extensions/v1beta1

DESCRIPTION:
  Ingress is a collection of rules that allow inbound connections to reach
  the endpoints defined by a backend. An Ingress can be configured to give
  services externally-reachable urls, load balance traffic, terminate SSL,
  offer name based virtual hosting etc. DEPRECATED - This group version of
  Ingress is deprecated by networking.k8s.io/v1beta1 Ingress. See the release
  notes for more information.

FIELDS:
  apiVersion    <string>
    APIVersion defines the versioned schema of this representation of an
    object. Servers should convert recognized schemas to the latest internal
    value, and may reject unrecognized values. More info:
    https://git.k8s.io/community/contributors/devel/sig-architecture/api-
    conventions.md#resources

  kind          <string>
    Kind is a string value representing the REST resource this object
    represents. Servers may infer this from the endpoint the client submits
    requests to. Cannot be updated. In CamelCase. More info:
    https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#types-
    kinds

  metadata      <Object>
    Standard object's metadata. More info:
    https://git.k8s.io/community/contributors/devel/sig-architecture/api-
    conventions.md#metadata

  spec          <Object>
    Spec is the desired state of the Ingress. More info:
    https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-
    and-status

  status        <Object>
    Status is the current state of the Ingress. More info:
    https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-
    and-status
```

查看 ingress.spec 配置清单

```

iMac:kubernetes neo$ kubectl explain ingress.spec
KIND:      Ingress
VERSION:   extensions/v1beta1

RESOURCE: spec <Object>

DESCRIPTION:
    Spec is the desired state of the Ingress. More info:
    https://git.k8s.io/community/contributors/devel/sig-architecture/api-conventions.md#spec-
    and-status

    IngressSpec describes the Ingress the user wishes to exist.

FIELDS:
    backend      <Object>
        A default backend capable of servicing requests that don't match any rule.
        At least one of 'backend' or 'rules' must be specified. This field is
        optional to allow the loadbalancer controller or defaulting logic to
        specify a global default.

    ingressClassName <string>
        IngressClassName is the name of the IngressClass cluster resource. The
        associated IngressClass defines which controller will implement the
        resource. This replaces the deprecated `kubernetes.io/ingress.class`
        annotation. For backwards compatibility, when that annotation is set, it
        must be given precedence over this field. The controller may emit a warning
        if the field and annotation have different values. Implementations of this
        API should ignore Ingresses without a class specified. An IngressClass
        resource may be marked as default, which can be used to set a default value
        for this field. For more information, refer to the IngressClass
        documentation.

    rules         <[]Object>
        A list of host rules used to configure the Ingress. If unspecified, or no
        rule matches, all traffic is sent to the default backend.

    tls           <[]Object>
        TLS configuration. Currently the Ingress only supports a single TLS port,
        443. If multiple members of this list specify different hosts, they will be
        multiplexed on the same port according to the hostname specified through
        the SNI TLS extension, if the ingress controller fulfilling the ingress
        supports SNI.

```

### 3.19. 操作系统

#### sysctls

```

kubelet --experimental-allowed-unsafe-sysctls
'kernel.msg*,kernel.shmmax,kernel.sem,net.ipv4.route.min_pmtu'

```

## 4. Rancher - Multi-Cluster Kubernetes Management

**Rancher is open-source software for delivering Kubernetes-as-a-Service.**

### 4.1. 安装

如果只是学习，可以安装最新版

```
docker run -d --restart=unless-stopped -p 80:80 -p 443:443 --name=rancher
rancher/rancher:latest
```

稳定版

```
docker run -d --restart=unless-stopped -p 80:80 -p 443:443 -v
/var/lib/rancher:/var/lib/rancher/ --name=rancher rancher/rancher:stable
```

审计日志

```
docker run -d --restart=unless-stopped -p 80:80 -p 443:443 -v
/var/lib/rancher:/var/lib/rancher/ -v /var/log/auditlog:/var/log/auditlog --
name=rancher rancher/rancher:stable
```

安装完，浏览器输入 <https://your-ip-address> 即可进入WebUI

防火墙放行 etcd

```
iptables -I INPUT -s 172.16.0.0/0 -p tcp --dport 2379 -j ACCEPT
iptables -I INPUT -s 172.16.0.0/0 -p tcp --dport 2380 -j ACCEPT
```

```
systemctl restart firewalld
systemctl enable firewalld

iptables -A INPUT -p tcp --dport 6443 -j ACCEPT
iptables -A INPUT -p tcp --dport 2379 -j ACCEPT
iptables -A INPUT -p tcp --dport 2380 -j ACCEPT
iptables -A INPUT -p tcp --dport 10250 -j ACCEPT

firewall-cmd --zone=public --add-port=6443/tcp --permanent
```

```
firewall-cmd --zone=public --add-port=2379/tcp --permanent
firewall-cmd --zone=public --add-port=2380/tcp --permanent
firewall-cmd --zone=public --add-port=10250/tcp --permanent
firewall-cmd --reload
```

```
hostnamectl set-hostname m-1d41c853af58
```

## Ubuntu

```
$ sudo ufw disable
```

## SSL 证书

### 第一种方式

```
docker run -d -p 8443:443 -v /srv/rancher/cacerts.pem:/etc/rancher/ssl/cacerts.pem -v
/srv/rancher/key.pem:/etc/rancher/ssl/key.pem -v
/srv/rancher/cert.crt:/etc/rancher/ssl/cert.pem rancher/rancher:latest
```

### 第二种方式

```
docker run -d --name rancher-server rancher/rancher:latest
docker run -d --name=nginx --restart=unless-stopped -p 80:80 -p 443:443 -v
/your_certificates:/your_certificates -v /etc/nginx.conf:/etc/nginx/conf.d/default.conf
--link=rancher-server nginx:1.11
```

## 进入容器

```
$ docker exec -it rancher /bin/bash
```

## Rancher CLI

```
cd /tmp
wget https://github.com/rancher/cli/releases/download/v2.2.0-rc16/rancher-linux-amd64-v2.2.0-rc16.tar.xz
tar Jxvf rancher-linux-amd64-v2.2.0-rc16.tar.xz
mv ./rancher-v2.2.0-rc16/rancher /usr/local/bin/
cd
```

## **rancher-compose**

Rancher Compose是一个多主机版本的Docker Compose

下载地址: <https://github.com/rancher/rancher-compose/releases>

```
cd /tmp

wget https://github.com/rancher/rancher-compose/releases/download/v0.12.5/rancher-compose-linux-amd64-v0.12.5.tar.xz
tar Jxvf rancher-compose-linux-amd64-v0.12.5.tar.xz
mv ./rancher-compose-v0.12.5/rancher-compose /usr/local/bin/

cd
```

## **4.2. 快速入门**

<https://www.cnrancher.com/docs/rancher/v2.x/cn/overview/quick-start-guide/>

# Welcome to Rancher

The first order of business is to set a strong password for the default `admin` user.

☒ Allow collection of anonymous statistics [Learn More](#)

---

☒ Set a specific password to use:

New Password

Confirm Password

☐ Use a new randomly generated password:

Continue

## Rancher Server URL

What URL should be used for this installation? All the nodes in your clusters will need to be able to reach this.

URL

https:// 192.168.0.157

Are you sure all the hosts you will create will be able to reach `192.168.0.157` ?  
It looks like a private IP or local network.

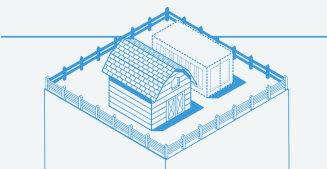

Save URL

## 4.3. Rancher CLI

```
[root@localhost ~]# rancher
Rancher CLI, managing containers one UTF-8 character at a time

Usage: rancher [OPTIONS] COMMAND [arg...]

Version: v2.2.0-rc16

Options:
  --debug          Debug logging
  --help, -h       show help
  --version, -v    print the version

Commands:
  apps, [app]           Operations with apps
  catalog               Operations with catalogs
  clusters, [cluster]   Operations on clusters
  context               Operations for the context
  globaldns             Operations on global DNS providers
  and entries
  inspect               View details of resources
  kubectl               Run kubectl commands
  login, [l]            Login to a Rancher server
  multiclusterapps, [multiclusterapp mcapps mcapp] Operations with multi-cluster apps
  namespaces, [namespace] Operations on namespaces
  nodes, [node]         Operations on nodes
  projects, [project]   Operations on projects
  ps                    Show workloads in a project
  settings, [setting]   Show settings for the current server
  ssh                   SSH into a node
  up                    apply compose config
  wait                  Wait for resources cluster, app,
project
  help, [h]             Shows a list of commands or help for
one command

Run 'rancher COMMAND --help' for more information on a command.
```

### 登陆 Rancher

链接到 Rancher

```
$ rancher login https://<SERVER_URL> --token <BEARER_TOKEN>
```

登陆演示

## 4.4. Rancher Compose

Rancher Compose 工具的工作方式是跟 Docker Compose 的工作方式是相似的，Docker Compose 不能远程部署，Rancher Compose 可以部署到指定URL的 Rancher 上。

```

[root@localhost ~]# rancher-compose
Usage: rancher-compose [OPTIONS] COMMAND [arg...]

Docker-compose to Rancher

```

```
Version: v0.12.5

Author:
  Rancher Labs, Inc.

Options:
  --verbose, --debug
  --file value, -f value      Specify one or more alternate compose files (default:
docker-compose.yml) [$COMPOSE_FILE]
  --project-name value, -p value Specify an alternate project name (default: directory
name) [$COMPOSE_PROJECT_NAME]
  --url value                 Specify the Rancher API endpoint URL [$RANCHER_URL]
  --access-key value          Specify Rancher API access key [$RANCHER_ACCESS_KEY]
  --secret-key value          Specify Rancher API secret key [$RANCHER_SECRET_KEY]
  --rancher-file value, -r value Specify an alternate Rancher compose file (default:
rancher-compose.yml)
  --env-file value, -e value   Specify a file from which to read environment
variables
  --bindings-file value, -b value Specify a file from which to read bindings
  --help, -h                  show help
  --version, -v               print the version

Commands:
  create      Create all services but do not start
  up          Bring all services up
  start       Start services
  logs        Get service logs
  restart     Restart services
  stop, down  Stop services
  scale       Scale services
  rm          Delete services
  pull        Pulls images for services
  upgrade     Perform rolling upgrade between services
  help        Shows a list of commands or help for one command

Run 'rancher-compose COMMAND --help' for more information on a command.
```

## Rancher Compose 命令

### 提示

Rancher Compose 目前不支持 V3 版的 Docker Compose

### 为 RANCHER COMPOSE 设置 RANCHER SERVER

```
# Set the url that Rancher is on
$ export RANCHER_URL=http://server_ip/
# Set the access key, i.e. username
$ export RANCHER_ACCESS_KEY=<username_of_environment_api_key>
# Set the secret key, i.e. password
$ export RANCHER_SECRET_KEY=<password_of_environment_api_key>
```

如果你不想设置环境变量，那么你需要在Rancher Compose 命令中手动送入这些变量:

```
$ rancher-compose --url http://server_ip --access-key <username_of_environment_api_key>
--secret-key <password_of_environment_api_key> up
```

Rancher Compose 支持所有 Docker Compose 支持的命令

| Name       | Description       |
|------------|-------------------|
| create     | 创建所有服务但不启动        |
| up         | 启动所有服务            |
| start      | 启动服务              |
| logs       | 输出服务日志            |
| restart    | 重启服务              |
| stop, down | 停止服务              |
| scale      | 缩放服务              |
| rm         | 删除服务              |
| pull       | 拉取所有服务的镜像         |
| upgrade    | 服务之间进行滚动升级        |
| help, h    | 输出命令列表或者指定命令的帮助列表 |

## RANCHER COMPOSE 选项

无论何时你使用 Rancher Compose 命令，这些不同的选项你都可以使用

| Name                                   | Description                                       |
|--|---|
| --verbose, --debug                     |   |
| --file, -f [-file option -file option] | 指定一个compose 文件 (默认: docker-compose.yml)           |
| [\$COMPOSE_FILE]                       |   |
| --project-name, -p                     | 指定一个项目名称 (默认: directory name)                     |
| --url                                  | 执行 Rancher API接口 URL [\$RANCHER_URL]              |
| --access-key                           | 指定 Rancher API access key [\$RANCHER_ACCESS_KEY]  |
| --secret-key                           | 指定 Rancher API secret key [\$RANCHER_SECRET_KEY]  |
| --rancher-file, -r                     | 指定一个 Rancher Compose 文件 (默认: rancher-compose.yml) |
| --env-file, -e                         | 指定一个环境变量配置文件                                      |
| --help, -h                             | 输出帮助文本  |
| --version, -v                          | 输出 Rancher Compose 版本                             |

## 操作演示

### API

## API Key已创建

访问地址:

`https://192.168.0.157/v3`

Access Key(用户名):

`token-pk9n2`

Secret Key(密码):

`p2twn42xps9nmh74qm5k5fhfn8rxqhlwv7q9hzcvbvqk5tsqwdh4tc`

Access Key和Secret Key可以作为HTTP基本身份验证的用户名和密码发送，以授权请求。您也可以将它们组合为Bearer Token:

Bearer Token:

`token-pk9n2:p2twn42xps9nmh74qm5k5fhfn8rxqhlwv7q9hzcvbvqk5tsqwdh4tc`

ⓘ 请保存上面的信息！ 这些信息仅显示一次。  
如果忘记了Secret Key，您需要重新创建新的API Key。

关闭

## 准备 docker-compose.yml 文件

```
rancher-compose --url https://rancher.netkiller.cn/v3 --access-key token-pk9n2 --secret-key p2twn42xps9nmh74qm5k5fhfn8rxqhlwv7q9hzcvbvqk5tsqwdh4tc up
```

## 4.5. Rancher Kubernetes Engine (RKE)

<https://github.com/rancher/rke/releases>

<https://rancher.com/an-introduction-to-rke/>

```
[root@localhost ~]# wget https://github.com/rancher/rke/releases/download/v0.1.17/rke
[root@localhost ~]# chmod +x rke
[root@localhost ~]# ./rke --version
rke version v0.1.17
```

## 4.6. Rancher CLI

```
rancher export project && cd project && rancher up -p --force-upgrade --batch-size 99 -u -c -d && cd .. && rm -rf project
```

## 4.7. 调试

```
neo@ubuntu:~$ docker logs -f rancher
```

```
$ curl -L http://127.0.0.1:2379/health  
{ "health": "true" }
```

## 4.8. FAQ

**[network] Host [rancher.netkiller.cn] is not able to connect to the following ports:  
[rancher.netkiller.cn:2379]. Please check network policies and firewall rules**

提示错误

[network] Host [rancher.netkiller.cn] is not able to connect to the following ports:  
[rancher.netkiller.cn:2379]. Please check network policies and firewall rules

排查

```
$ docker logs -f share-mnt  
  
Error response from daemon: {"message": "No such container: kubelet"}  
Error: failed to start containers: kubelet
```

```
neo@m-1d41c853af58:~$ snap list  
Name      Version      Rev    Tracking    Publisher    Notes  
core      16-2.37.4    6531   stable     canonical✓   core  
go        1.12         3318   stable     mwahudson    classic  
kubectl   1.13.4       780    stable     canonical✓   classic  
lxd       3.11         10343  stable/...  canonical✓   -  
microk8s  v1.14.0-beta.1 442    1.14/beta  canonical✓   classic  
  
neo@m-1d41c853af58:~$ snap remove microk8s kubectl lxd  
error: access denied (try with sudo)  
  
neo@m-1d41c853af58:~$ sudo snap remove microk8s kubectl lxd  
sudo: unable to resolve host m-1d41c853af58: Invalid argument  
microk8s removed  
kubectl removed  
lxd removed
```

## 5. Helm - The package manager for Kubernetes

<https://helm.sh>

### 5.1. 安装 Helm

#### Ubuntu

```
snap install helm --classic
```

#### Mac

homebrew 安装 Helm

```
iMac:~ neo$ brew install helm

iMac:~ neo$ helm version
version.BuildInfo{Version:"v3.3.3", GitCommit:"55e3ca022e40fe200fbc855938995f40b2a68ce0",
GitTreeState:"dirty", GoVersion:"go1.15.2"}
```

#### 旧版本

```
brew install kubernetes-helm
```

### 5.2. 快速开始

```
# 初始化本地, 并将 Tiller 安装到 Kubernetes cluster
$ helm init

# 更新本地 charts repo
$ helm repo update

# 安装 mysql chart
$ helm install --name my-mysql stable/mysql

# 删除 mysql
$ helm delete my-mysql

# 删除 mysql 并释放该名字以便后续使用
$ helm delete --purge my-mysql
```

### 5.3. Helm 命令

## 初始化 Helm

```
neo@MacBook-Pro ~ % helm init
Creating /Users/neo/.helm
Creating /Users/neo/.helm/repository
Creating /Users/neo/.helm/repository/cache
Creating /Users/neo/.helm/repository/local
Creating /Users/neo/.helm/plugins
Creating /Users/neo/.helm/starters
Creating /Users/neo/.helm/cache/archive
Creating /Users/neo/.helm/repository/repositories.yaml
Adding stable repo with URL: https://kubernetes-charts.storage.googleapis.com
Adding local repo with URL: http://127.0.0.1:8879/charts
$HELM_HOME has been configured at /Users/neo/.helm.
Warning: Tiller is already installed in the cluster.
(Use --client-only to suppress this message, or --upgrade to upgrade Tiller to the current
version.)
Happy Helming!
```

## 查看仓库列表

查看当前的 Charts 包仓库

```
neo@MacBook-Pro ~ % helm repo list
NAME      URL
stable    https://kubernetes-charts.storage.googleapis.com
local     http://127.0.0.1:8879/charts
```

## 更新仓库

```
neo@MacBook-Pro ~ % helm repo update
Hang tight while we grab the latest from your chart repositories...
...Skip local chart repository
...Unable to get an update from the "stable" chart repository (https://kubernetes-
charts.storage.googleapis.com):
      unexpected EOF
Update Complete. * Happy Helming! *
```

## 搜索

在stable仓库搜索 redis应用

```
neo@MacBook-Pro ~ % helm search stable/redis
NAME          CHART VERSION  APP VERSION  DESCRIPTION
stable/redis  6.4.3          4.0.14       Open source, advanced key-value store. It is
often refer...
stable/redis-ha 3.3.3          5.0.3        Highly available Kubernetes implementation of
Redis
```

## 查看包信息

### 查看包详细信息与帮助手册

```
neo@MacBook-Pro ~ % helm inspect stable/redis
```

## 安装

```
$ helm install stable/redis
$ helm install --name=redis stable/redis
```

```
neo@MacBook-Pro ~ % helm install stable/redis
NAME:      vested-termite
LAST DEPLOYED: Sun Mar 31 17:46:02 2019
NAMESPACE: default
STATUS:    DEPLOYED

vested-termite-redis-slave        0/1    1            0           0s

==> v1beta2/StatefulSet
NAME                                READY  AGE
vested-termite-redis-master        0/1    0s

NOTES:
** Please be patient while the chart is being deployed **
Redis can be accessed via port 6379 on the following DNS names from within your cluster:

vested-termite-redis-master.default.svc.cluster.local for read/write operations
vested-termite-redis-slave.default.svc.cluster.local for read-only operations

To get your password run:
```

```
export REDIS_PASSWORD=$(kubectl get secret --namespace default vested-termite-redis -o
jsonpath="{.data.redis-password}" | base64 --decode)

To connect to your Redis server:

1. Run a Redis pod that you can use as a client:

    kubectl run --namespace default vested-termite-redis-client --rm --tty -i --restart='Never'
\
    --env REDIS_PASSWORD=$REDIS_PASSWORD \
    --image docker.io/bitnami/redis:4.0.14 -- bash

2. Connect using the Redis CLI:
redis-cli -h vested-termite-redis-master -a $REDIS_PASSWORD
redis-cli -h vested-termite-redis-slave -a $REDIS_PASSWORD

To connect to your database from outside the cluster execute the following commands:

    kubectl port-forward --namespace default svc/vested-termite-redis 6379:6379 &
    redis-cli -h 127.0.0.1 -p 6379 -a $REDIS_PASSWORD
```

## 列表

```
neo@MacBook-Pro ~ % helm list
NAME                REVISION      UPDATED              STATUS      CHART
APP VERSION          NAMESPACE

NAME                TYPE      CLUSTER-IP    EXTERNAL-IP  PORT(S)    AGE
vested-termite-redis-master  ClusterIP  10.98.194.187  <none>        6379/TCP   111m
vested-termite-redis-slave  ClusterIP  10.111.85.208  <none>        6379/TCP   111m

==> v1beta1/Deployment
NAME                READY  UP-TO-DATE  AVAILABLE  AGE
vested-termite-redis-slave  1/1    1            1          111m

==> v1beta2/StatefulSet
NAME                READY  AGE
vested-termite-redis-master  1/1    111m

NOTES:
** Please be patient while the chart is being deployed **
Redis can be accessed via port 6379 on the following DNS names from within your cluster:

vested-termite-redis-master.default.svc.cluster.local for read/write operations
vested-termite-redis-slave.default.svc.cluster.local for read-only operations

To get your password run:

    export REDIS_PASSWORD=$(kubectl get secret --namespace default vested-termite-redis -o
jsonpath="{.data.redis-password}" | base64 --decode)

To connect to your Redis server:

1. Run a Redis pod that you can use as a client:

    kubectl run --namespace default vested-termite-redis-client --rm --tty -i --restart='Never'
\
    --env REDIS_PASSWORD=$REDIS_PASSWORD \
    --image docker.io/bitnami/redis:4.0.14 -- bash

2. Connect using the Redis CLI:
    redis-cli -h vested-termite-redis-master -a $REDIS_PASSWORD
    redis-cli -h vested-termite-redis-slave -a $REDIS_PASSWORD

```

To connect to your database from outside the cluster execute the following commands:

```
kubectrl port-forward --namespace default svc/vested-termite-redis 6379:6379 &  
redis-cli -h 127.0.0.1 -p 6379 -a $REDIS_PASSWORD
```

## 5.4. elastic

```
helm repo add elastic https://helm.elastic.co
```

## 5.5. Helm Faq

## 6. kubectl example

### 6.1. 私有 registry

```
kubectl create deployment registry --image=registry:latest
kubectl expose deployment registry --port=5000 --target-
port=5000
kubectl delete -n default deployment registry
```

```
iMac:registry neo$ docker pull nginx:latest
iMac:registry neo$ docker tag nginx:latest
192.168.64.2:30050/nginx:latest
iMac:registry neo$ docker push 192.168.64.2:30050/nginx:latest

kubectl create deployment nginx --
image=192.168.64.2:30050/nginx:latest
kubectl expose deployment nginx --port=80 --target-port=30080 -
-type=NodePort

kubectl create deployment busybox --image=docker.io/busybox
kubectl create deployment busybox --image=busybox
kubectl create deployment welcome --
image=127.0.0.1:5000/netkiller/welcome

docker tag busybox:latest 192.168.64.6:32070/busybox:latest
docker push 192.168.64.6:32070/busybox:latest
```

### 6.2. mongodb

```
kubectl run mongodb --image=docker.io/mongo --  
env="p='27017:27017'" --env="v='/opt/mongodb:/data'"  
kubectl expose deployment mongodb --port=27017 --target-  
port=27017
```

### 6.3. tomcat

```
kubectl create deployment hello-minikube --image=tomcat:8.0  
kubectl expose deployment hello-minikube --type=NodePort --  
port=80  
minikube service hello-minikube --url
```

## 7. Kubectl YAML

### 7.1. ServiceAccount

```
apiVersion: v1
kind: ServiceAccount
metadata:
  labels:
    app: elasticsearch
  name: elasticsearch
  namespace: elastic
```

### 7.2. 创建命名空间

创建 jenkins-namespace.yaml

```
apiVersion: v1
kind: Namespace
metadata:
  name: jenkins-project
```

```
$ kubectl create -f jenkins-namespace.yaml
namespace "jenkins-project" created
```

### 7.3. Pod

```
apiVersion: v1
kind: Pod
metadata:
  name: counter
spec:
  containers:
    - name: count
      image: busybox
      args: [/bin/sh, -c, 'i=0; while true; do echo "$i: $(date)"; i=$((i+1)); sleep 1; done']
```

```
iMac:kubernetes neo$ kubectl create -f pod.yaml
pod/counter created
```

```
iMac:kubernetes neo$ kubectl logs counter
0: Sun Oct  4 12:32:44 UTC 2020
1: Sun Oct  4 12:32:45 UTC 2020
2: Sun Oct  4 12:32:46 UTC 2020
3: Sun Oct  4 12:32:47 UTC 2020
4: Sun Oct  4 12:32:48 UTC 2020
5: Sun Oct  4 12:32:49 UTC 2020
6: Sun Oct  4 12:32:50 UTC 2020
7: Sun Oct  4 12:32:51 UTC 2020
8: Sun Oct  4 12:32:52 UTC 2020
9: Sun Oct  4 12:32:53 UTC 2020
```

## 指定主机名

```
apiVersion: v1
kind: Pod
metadata:
  name: hostaliases-pod
spec:
  restartPolicy: Never
  hostAliases:
    - ip: "127.0.0.1"
      hostnames:
        - "foo.local"
        - "bar.local"
    - ip: "10.1.2.3"
      hostnames:
        - "foo.remote"
        - "bar.remote"
  containers:
    - name: cat-hosts
      image: busybox
      command:
        - cat
      args:
        - "/etc/hosts"
```

```
apiVersion: v1
kind: Pod
metadata:
  name: envvars-fieldref
spec:
  containers:
    - name: test-container
      image: k8s.gcr.io/busybox
      command: [ "sh", "-c" ]
      args:
        - while true; do
            echo -en '\n';
            printenv NODE_NAME POD_NAME POD_NAMESPACE;
            printenv POD_IP POD_SERVICE_ACCOUNT;
            sleep 10;
```

```

done;
env:
  - name: NODE_NAME
    valueFrom:
      fieldRef:
        fieldPath: spec.nodeName
  - name: POD_NAME
    valueFrom:
      fieldRef:
        fieldPath: metadata.name
  - name: POD_NAMESPACE
    valueFrom:
      fieldRef:
        fieldPath: metadata.namespace
  - name: POD_IP
    valueFrom:
      fieldRef:
        fieldPath: status.podIP
  - name: POD_SERVICE_ACCOUNT
    valueFrom:
      fieldRef:
        fieldPath: spec.serviceAccountName
restartPolicy: Never

```

```

apiVersion: v1
kind: Pod
metadata:
  name: envvars-resourcefieldref
spec:
  containers:
    - name: test-container
      image: k8s.gcr.io/busybox:1.24
      command: [ "sh", "-c" ]
      args:
        - while true; do
            echo -en '\n';
            printenv CPU_REQUEST CPU_LIMIT;
            printenv MEM_REQUEST MEM_LIMIT;
            sleep 10;
          done;
      resources:
        requests:
          memory: "32Mi"
          cpu: "125m"
        limits:
          memory: "64Mi"
          cpu: "250m"
      env:
        - name: CPU_REQUEST
          valueFrom:
            resourceFieldRef:
              containerName: test-container
              resource: requests.cpu
        - name: CPU_LIMIT
          valueFrom:
            resourceFieldRef:
              containerName: test-container
              resource: limits.cpu

```

```

- name: MEM_REQUEST
  valueFrom:
    resourceFieldRef:
      containerName: test-container
      resource: requests.memory
- name: MEM_LIMIT
  valueFrom:
    resourceFieldRef:
      containerName: test-container
      resource: limits.memory
restartPolicy: Never

```

## 健康状态检查

### 就绪探针

```

readinessProbe:
  exec:
    command:
      - cat
      - /tmp/healthy
  initialDelaySeconds: 10
  periodSeconds: 5

```

#10s之后开始第一次探测  
#第一次探测之后每隔5s探测一次

## securityContext

### sysctls

```

kubelet --allowed-unsafe-sysctls \
'kernel.msg*,net.core.somaxconn' ...

```

```

apiVersion: v1
kind: Pod
metadata:
  name: sysctl-example
spec:
  securityContext:
    sysctls:
      - name: kernel.shm_rmid_forced
        value: "0"
      - name: net.core.somaxconn
        value: "1024"
      - name: kernel.msgmax
        value: "65536"

```

## runAsUser

allowPrivilegeEscalation 表示是否继承父进程权限，runAsUser 表示使用 UID 1000 的用户运行

```
apiVersion: v1
kind: Pod
metadata:
  name: security-context-demo
spec:
  securityContext:
    runAsUser: 1000
  containers:
  - name: sec-ctx-demo
    image: busybox:latest
    securityContext:
      runAsUser: 1000
      allowPrivilegeEscalation: false
```

```
spec:
  securityContext:
    runAsUser: 1000
    fsGroup: 2000
    runAsNonRoot: true
```

## security.alpha.kubernetes.io/sysctls

security.alpha.kubernetes.io/sysctls

```
apiVersion: v1
kind: Pod
metadata:
  name: sysctl-example
  annotations:
    security.alpha.kubernetes.io/sysctls: kernel.shm_rmid_forced=1
spec:
```

## unsafe-sysctls

```
apiVersion: v1
kind: Pod
metadata:
  name: sysctl-example
  annotations:
    security.alpha.kubernetes.io/unsafe-sysctls: net.core.somaxconn=65535
#使用unsafe sysctl, 设置最大连接数
spec:
```

```
securityContext:
  privileged: true
#开启privileged权限
```

## Taint（污点）和 Toleration（容忍）

## 7.4. Service

### 创建服务

创建 service.yaml 文件

```
apiVersion: v1
kind: Service
metadata:
  name: my-service
spec:
  selector:
    app: MyApp
  ports:
    - name: http
      protocol: TCP
      port: 80
      targetPort: 80
    - name: https
      protocol: TCP
      port: 443
      targetPort: 443
```

```
iMac:kubernetes neo$ kubectl create -f service.yaml
service/my-service created
```

查看服务

```
iMac:kubernetes neo$ kubectl get service
```

| NAME       | TYPE      | CLUSTER-IP     | EXTERNAL-IP | PORT(S)        | AGE  |
|------------|-----------|----------------|-------------|----------------|------|
| kubernetes | ClusterIP | 10.96.0.1      | <none>      | 443/TCP        | 113m |
| my-service | ClusterIP | 10.106.157.143 | <none>      | 80/TCP,443/TCP | 64s  |

查看 service 后端代理的 pod 的 ip，这里没有挂载 pod 所以显示 none

```
iMac:kubernetes neo$ kubectl get endpoints my-service
NAME            ENDPOINTS          AGE
my-service      <none>             2m20s
```

查看服务

设置外部IP

报漏 80.11.12.10:80 地址

```
apiVersion: v1
kind: Service
metadata:
  name: my-service
spec:
  selector:
    app: MyApp
  ports:
    - name: http
      protocol: TCP
      port: 80
      targetPort: 9376
  externalIPs:
    - 80.11.12.10
```

绑定外部域名

```
apiVersion: v1
kind: Service
metadata:
  name: my-service
  namespace: prod
spec:
  type: ExternalName
  externalName: my.database.example.com
```

```
apiVersion: v1
kind: Service
metadata:
  name: spring-cloud-config-server
  namespace: default
labels:
```

```
    app: springboot
spec:
  #type: NodePort
  ports: web
  - port: 8888
    targetPort: web
  clusterIP: 10.10.0.1
  selector:
    app: spring-cloud-config-server
```

## nodePort

```
apiVersion: v1
kind: Service
metadata:
  name: my-service
spec:
  type: NodePort
  selector:
    app: MyApp
  ports:
    # By default and for convenience, the `targetPort` is set to the same value as the
    # `port` field.
    - port: 80
      targetPort: 80
    # Optional field
    # By default and for convenience, the Kubernetes control plane will allocate a
    # port from a range (default: 30000-32767)
    nodePort: 30007
```

## LoadBalancer

```
apiVersion: v1
kind: Service
metadata:
  name: my-service
spec:
  selector:
    app: MyApp
  ports:
    - protocol: TCP
      port: 80
      targetPort: 9376
  clusterIP: 10.0.171.239
  type: LoadBalancer
status:
  loadBalancer:
    ingress:
      - ip: 192.0.2.127
```

## Example

```
apiVersion: v1
kind: Service
metadata:
  name: registry
  namespace: default
  labels:
    app: registry
spec:
  type: NodePort
  selector:
    app: registry
  ports:
    - name: registry
      port: 5000
      nodePort: 30050
      protocol: TCP
---
apiVersion: apps/v1
kind: Deployment
metadata:
  name: registry
  namespace: default
  labels:
    app: registry
spec:
  replicas: 1
  selector:
    matchLabels:
      app: registry
  template:
    metadata:
      labels:
        app: registry
    spec:
      containers:
        - name: registry
          image: registry:latest
          resources:
            limits:
              cpu: 100m
              memory: 100Mi
          env:
            - name: REGISTRY_HTTP_ADDR
              value: :5000
            - name: REGISTRY_STORAGE_FILESYSTEM_ROOTDIRECTORY
              value: /var/lib/registry
          ports:
            - containerPort: 5000
              name: registry
              protocol: TCP
```

## 7.5. ConfigMap

### Key-Value 配置

```
apiVersion: v1
kind: ConfigMap
metadata:
  name: db-config
  namespace: default
data:
  db.host: 172.16.0.10
  db.port: '3306'
  db.user: neo
  db.pass: chen
```

## 创建配置

```
neo@MacBook-Pro-Neo ~/tmp/kubernetes % kubectl create -f key-value.yaml
configmap/db-config created
```

## 将配置项保存到文件

```
apiVersion: v1
kind: Pod
metadata:
  name: test-pod
spec:
  containers:
    - name: test-container
      image: gcr.io/google_containers/busybox
      command: [ "/bin/sh", "-c", "cat /usr/local/etc/config/db.host" ]
      volumeMounts:
        - name: config-volume
          mountPath: /usr/local/etc/config
  volumes:
    - name: config-volume
      configMap:
        name: db-config
  restartPolicy: Never
```

## 定义多组配置项

```
apiVersion: v1
kind: ConfigMap
metadata:
  name: spring-cloud-config
  namespace: default
data:
  config: |
    spring.security.user=config
    spring.security.user=passwd
```

```
eureka: |
  spring.security.user=eureka
  spring.security.user=passwd0rd
gateway: |
  spring.security.user=gateway
  spring.security.user=passwd0rd
```

## 环境变量

envFrom 可将 ConfigMap 中的配置项定义为容器环境变量

```
apiVersion: v1
kind: Pod
metadata:
  name: neo-test-pod
spec:
  containers:
    - name: test-container
      image: k8s.gcr.io/busybox
      command: [ "/bin/sh", "-c", "env" ]
      envFrom:
        - configMapRef:
            name: special-config
      restartPolicy: Never
```

引用单个配置项使用 valueFrom

```
neo@MacBook-Pro-Neo ~/tmp/kubernetes % cat key-value.yaml
apiVersion: v1
kind: ConfigMap
metadata:
  name: db-config
  namespace: default
data:
  db.host: 172.16.0.10
  db.port: '3306'
  db.user: neo
  db.pass: chen
---
apiVersion: v1
kind: Pod
metadata:
  name: test-pod
spec:
  containers:
    - name: test-container
      image: busybox
      command: [ "/bin/sh", "-c", "env" ]
      env:
        - name: DBHOST
          valueFrom:
            configMapKeyRef:
```

```
        name: db-config
        key: db.host
    - name: DBPORT
      valueFrom:
        configMapKeyRef:
          name: db-config
          key: db.port
  restartPolicy: Never

neo@MacBook-Pro-Neo ~/tmp/kubernetes % kubectl create -f key-value.yaml
configmap/db-config created
pod/test-pod created
```

## 配置文件

### 定义配置

```
apiVersion: v1
kind: ConfigMap
metadata:
  name: redis-config
  labels:
    app: redis
data:
  redis.conf: |-
    pidfile /var/lib/redis/redis.pid
    dir /var/lib/redis
    port 6379
    bind 0.0.0.0
    appendonly yes
    protected-mode no
    requirepass 123456
```

### 引用配置

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: redis
  labels:
    app: redis
spec:
  replicas: 1
  selector:
    matchLabels:
      app: redis
  template:
    metadata:
      labels:
        app: redis
    spec:
      containers:
```

```

- name: redis
  image: redis:5.0.8
  command:
    - "sh"
    - "-c"
    - "redis-server /usr/local/etc/redis/redis.conf"
  ports:
    - containerPort: 6379
  resources:
    limits:
      cpu: 1000m
      memory: 1024Mi
    requests:
      cpu: 1000m
      memory: 1024Mi
  livenessProbe:
    tcpSocket:
      port: 6379
    initialDelaySeconds: 300
    timeoutSeconds: 1
    periodSeconds: 10
    successThreshold: 1
    failureThreshold: 3
  readinessProbe:
    tcpSocket:
      port: 6379
    initialDelaySeconds: 5
    timeoutSeconds: 1
    periodSeconds: 10
    successThreshold: 1
    failureThreshold: 3
  volumeMounts:
    - name: data
      mountPath: /data
    - name: config
      mountPath: /usr/local/etc/redis/redis.conf
      subPath: redis.conf
  volumes:
    - name: data
      persistentVolumeClaim:
        claimName: redis
    - name: config
      configMap:
        name: redis-config

```

```

apiVersion: v1
kind: Pod
metadata:
  name: test-pod
spec:
  containers:
    - name: test-container
      image: gcr.io/google_containers/busybox
      command: [ "/bin/sh", "-c", "find /etc/config/" ]
      volumeMounts:
        - name: config-volume
          mountPath: /etc/config
  volumes:

```

```
- name: config-volume
  configMap:
    name: special-config
    items:
      - key: special.how
        path: path/to/special-key
  restartPolicy: Never
```

## 7.6. Volume

### local

```
apiVersion: v1
kind: PersistentVolume
metadata:
  name: example-pv
spec:
  capacity:
    storage: 100Gi
  # volumeMode field requires BlockVolume Alpha feature gate to be enabled.
  volumeMode: Filesystem
  accessModes:
    - ReadWriteOnce
  persistentVolumeReclaimPolicy: Delete
  storageClassName: local-storage
  local:
    path: /mnt/disks/ssd1
  nodeAffinity:
    required:
      nodeSelectorTerms:
        - matchExpressions:
            - key: kubernetes.io/hostname
              operator: In
              values:
                - example-node
```

### 案例

```
apiVersion: storage.k8s.io/v1
kind: StorageClass
metadata:
  name: local-volume
provisioner: kubernetes.io/no-provisioner
volumeBindingMode: WaitForFirstConsumer
---
apiVersion: v1
kind: PersistentVolume
metadata:
  name: netkiller-local-pv
spec:
  capacity:
    storage: 1Gi
```

```

accessModes:
- ReadWriteOnce
persistentVolumeReclaimPolicy: Retain
storageClassName: local-volume
local:
  path: /tmp/neo
nodeAffinity:
  required:
    nodeSelectorTerms:
    - matchExpressions:
      - key: kubernetes.io/hostname
        operator: In
        values:
        - minikube
---
apiVersion: v1
kind: PersistentVolumeClaim
metadata:
  name: netkiller-pvc
spec:
  accessModes:
  - ReadWriteOnce
  resources:
    requests:
      storage: 1Gi

---
kind: Pod
apiVersion: v1
metadata:
  name: busybox
  namespace: default
spec:
  containers:
  - name: busybox
    image: busybox:latest
    # image: registry.netkiller.cn:5000/netkiller/welcome:latest
    imagePullPolicy: IfNotPresent
    command:
    - sleep
    - "3600"
    volumeMounts:
    - mountPath: "/srv"
      name: mypd
  restartPolicy: Always
  volumes:
  - name: mypd
    persistentVolumeClaim:
      claimName: netkiller-pvc

```

## 部署 POD

```

iMac:kubernetes neo$ kubectl create -f example/volume/local.yaml
storageclass.storage.k8s.io/local-volume created
persistentvolume/netkiller-local-pv created
persistentvolumeclaim/netkiller-pvc created
pod/busybox created

```

## 查看POD状态

```
iMac:kubernetes neo$ kubectl get pod
NAME          READY   STATUS    RESTARTS   AGE
busybox       1/1     Running   0           2m28s
```

进入POD查看local卷的挂载情况，同时创建一个测试文件。

```
iMac:kubernetes neo$ kubectl exec -it busybox sh
kubectl exec [POD] [COMMAND] is DEPRECATED and will be removed in a future version. Use
kubectl exec [POD] -- [COMMAND] instead.
/ # mount | grep /srv
tmpfs on /srv type tmpfs (rw)

/ # echo helloworld > /srv/netkiller
/ # cat /srv/netkiller
helloworld
```

进入宿主主机查看挂载目录

```
$ cat /tmp/neo/netkiller
helloworld
```

## 7.7. Job

### 执行单词任务

.spec.completions 标志Job结束需要成功运行的Pod个数，默认为1

.spec.parallelism 标志并行运行的Pod的个数，默认为1

.spec.activeDeadlineSeconds 标志失败Pod的重试最大时间，超过这个时间不会继续重试

```
apiVersion: batch/v1
kind: Job
metadata:
  name: busybox
spec:
  completions: 1
  parallelism: 1
  template:
```

```
metadata:
  name: busybox
spec:
  containers:
  - name: busybox
    image: busybox
    command: ["echo", "hello"]
    restartPolicy: Never
```

```
$ kubectl create -f job.yaml
job "busybox" created
$ pods=$(kubectl get pods --selector=job-name=busybox --output=jsonpath=
{.items..metadata.name})
$ kubectl logs $pods
```

## 计划任务

.spec.schedule 指定任务运行周期，格式同Cron

.spec.startingDeadlineSeconds 指定任务开始的截止期限

.spec.concurrencyPolicy 指定任务的并发策略，支持Allow、Forbid和Replace三个选项

```
apiVersion: batch/v2alpha1
kind: CronJob
metadata:
  name: hello
spec:
  schedule: "*/1 * * * *"
  jobTemplate:
    spec:
      template:
        spec:
          containers:
          - name: hello
            image: busybox
            args:
            - /bin/sh
            - -c
            - date; echo Hello from the Kubernetes cluster
          restartPolicy: OnFailure
```

## 7.8. Ingress

正常情况 Service 只是暴露了端口，这个端口是可以对外访问的，但是80端口 只有一个，很多 Service 都要使用 80端口，这时就需要使用虚拟主机技术。

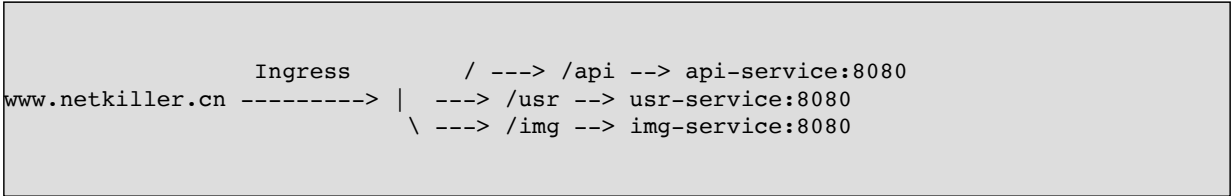

多个 Service 共同使用一个 80 端口，通过域名区分业务。这就是 Ingress 存在的意义。

端口

```
apiVersion: networking.k8s.io/v1
kind: Ingress
metadata:
  name: springboot
spec:
  backend:
    service:
      name: springboot
      port:
        number: 80
```

URI 规则

```
apiVersion: networking.k8s.io/v1beta1
kind: Ingress
metadata:
  name: uri-ingress
  annotations:
    nginx.ingress.kubernetes.io/rewrite-target: /
spec:
  rules:
  - host: www.netkiller.cn
    http:
      paths:
      - path: /api
        backend:
          serviceName: api-service
          servicePort: 8080
      - path: /usr
        backend:
          serviceName: usr-service
          servicePort: 8080
      - path: /img
        backend:
          serviceName: img-service
          servicePort: 8080
```

## vhost 虚拟主机

```
www.netkiller.cn --|      Ingress      |-> www.netkiller.cn www:80
                    |----->         |
img.netkiller.cn  --|                  |-> img.netkiller.cn img:80
```

```
apiVersion: networking.k8s.io/v1beta1
kind: Ingress
metadata:
  name: vhost-ingress
spec:
  rules:
  - host: www.netkiller.cn
    http:
      paths:
      - backend:
          serviceName: www
          servicePort: 80
  - host: img.netkiller.cn
    http:
      paths:
      - backend:
          serviceName: img
          servicePort: 80
```

## rewrite

```
http://www.netkiller.cn/1100 => /article/1100
```

```
apiVersion: networking.k8s.io/v1beta1
kind: Ingress
metadata:
  name: rewrite-ingress
  annotations:
    nginx.ingress.kubernetes.io/rewrite-target: /article/$1
spec:
  rules:
  - host: www.netkiller.cn
    http:
      paths:
      # 可以有多个 (可以正则)
      - path: /($/.*?)
        backend:
```

```
serviceName: article
servicePort: 80
```

## annotations 配置

### HTTP 跳转到 HTTPS

```
# 该注解只在配置了HTTPS之后才会生效进行跳转
nginx.ingress.kubernetes.io/ssl-redirect: "true"

# 强制跳转到https, 不论是否配置了https证书
nginx.ingress.kubernetes.io/force-ssl-redirect: "true"
```

### server-snippet

server-snippet 可以让你直接编排 Nginx 配置

```
nginx.ingress.kubernetes.io/server-snippet: |
    rewrite /api/($|.* ) /api/v2/$1 break;
    rewrite /img/($|.* ) /img/thumbnail/$1 break;
```

## 金丝雀发布（灰度发布）

三种annotation按匹配优先级顺序：

```
canary-by-header > canary-by-cookie > canary-weight
```

### 准备服务

```
# Release Version
apiVersion: v1
kind: Service
metadata:
  name: hello-service
  labels:
    app: hello-service
spec:
  ports:
  - port: 80
    protocol: TCP
  selector:
    app: hello-service
```

```

---
# canary Version
apiVersion: v1
kind: Service
metadata:
  name: canary-hello-service
  labels:
    app: canary-hello-service
spec:
ports:
- port: 80
  protocol: TCP
selector:
  app: canary-hello-service

```

方案一，权重分配

```

apiVersion: extensions/v1beta1
kind: Ingress
metadata:
  name: canary
  annotations:
    kubernetes.io/ingress.class: nginx
    nginx.ingress.kubernetes.io/canary: "true"
    nginx.ingress.kubernetes.io/canary-weight: "30"
spec:
  rules:
  - host: canary.netkiller.cn
    http:
      paths:
      - backend:
          serviceName: canary-hello-service

```

```
$ for i in $(seq 1 10); do curl http://canary.netkiller.cn; echo '\n'; done
```

通过HTTP头开启灰度发布

```

annotations:
  kubernetes.io/ingress.class: nginx
  nginx.ingress.kubernetes.io/canary: "true"
  nginx.ingress.kubernetes.io/canary-by-header: "canary"

```

```
$ for i in $(seq 1 5); do curl -H 'canary:always' http://canary.netkiller.cn; echo '\n'; done
```

```
annotations:
  kubernetes.io/ingress.class: nginx
  nginx.ingress.kubernetes.io/canary: "true"
  nginx.ingress.kubernetes.io/canary-by-header: "canary"
  nginx.ingress.kubernetes.io/canary-by-header-value: "true"
```

```
$ for i in $(seq 1 5); do curl -H 'canary:true' http://canary.netkiller.cn; echo '\n';
done
```

通过 **Cookie** 开启

```
annotations:
  kubernetes.io/ingress.class: nginx
  nginx.ingress.kubernetes.io/canary: "true"
  nginx.ingress.kubernetes.io/canary-by-cookie: "canary"
```

```
$ for i in $(seq 1 5); do curl -b 'canary=always' http://canary.netkiller.cn; echo '\n';
done
```

## 管理 **Ingress**

```
# 查看已有配置
kubectl describe ingress test

# 修改配置
kubectl edit ingress test

# 来重新载入配置
kubectl replace -f ingress.yaml
```

## 8. istio

### 8.1. 启动 istio

下面的例子是在 default 命名空间启用 istio。

```
$ kubectl label namespace default istio-injection=enabled  
namespace/default labeled
```

### 8.2. 禁用 istio

如果在该namespace下创建pod，不想要使用istio-proxy，可以在创建的pod中annotations 配置项声明禁用 istio

```
apiVersion: v1  
kind: Pod  
metadata:  
  annotations:  
    sidecar.istio.io/inject: "false"
```

## 9. Kubeapps

Kubeapps is a web-based UI for deploying and managing applications in Kubernetes clusters

<https://kubeapps.com>

# 第 3 章 Virtual Machine(虚拟机)

## 1. Kernel-based Virtual Machine(KVM)

<http://wiki.centos.org/HowTos/KVM>

### 1.1. kvm install usage yum

确认处理器是否支持KVM

```
egrep 'vmx|svm' /proc/cpuinfo
```

对当前系统做一个全面升级

```
sudo yum update  
sudo yum upgrade
```

Installing

如果你不想安装Virtualization组，想单独安装需要的软件，可是使用下面命令

```
# yum install qemu-kvm libvirt virt-install bridge-utils
```

确认kvm已经安装

**lsmod | grep kvm**

```
# lsmod | grep kvm  
kvm_intel          138567  0
```

```
kvm                441119    1  kvm_intel
```

Create the disk image

**qemu-img create -f qcow2 disk.img 5G**

or

**dd if=/dev/zero of=disk.img bs=1G count=5**

```
# qemu-img create -f qcow2 disk.img 5G
Formatting 'disk.img', fmt=qcow2, size=5242880 kB

# dd if=/dev/zero of=disk.img bs=1G count=5
5+0 records in
5+0 records out
5368709120 bytes (5.4 GB) copied, 61.0353 seconds, 88.0 MB/s
```

Creating a virtual machine

```
/usr/libexec/qemu-kvm -hda disk.img -cdrom archlinux-2009.08-
core-x86_64.iso -m 512 -boot d
```

如果你不在localhost上安装OS,你需要指定vnc,这样你可以远程连接到kvm

```
[root@scientific ~]# /usr/libexec/qemu-kvm disk.img -cdrom
rhel-server-5.6-x86_64-dvd.iso -m 8000 -boot d -vnc :1
```

```
[root@scientific ~]# yum install -y virt-manager virt-top virt-
v2v virt-viewer
or
[root@scientific ~]# yum groupinstall 'Virtualization'
```

## brctl / tunctl

```
[root@scientific ~]# yum install -y tunctl
```

## DHCP

```
brctl addbr br0
ifconfig eth0 0.0.0.0
brctl addif br0 eth0
dhclient br0
tunctl -b -u root
ifconfig tap0 up
brctl addif br0 tap0
```

## STATIC IP Address

```
brctl addbr br0
ifconfig eth0 0.0.0.0
brctl addif br0 eth0
ifconfig br0 up
tunctl -b -u root
ifconfig tap0 up
brctl addif br0 tap0

ifconfig br0 192.168.1.120 netmask 255.255.255.0 up
ip route add default via 192.168.3.1 dev br0
```

```
[root@scientific ~]# ip route
192.168.3.0/24 dev br0 proto kernel scope link src
192.168.3.43
192.168.3.0/24 dev tap0 proto kernel scope link src
192.168.3.21

default via 192.168.3.1 dev br0
[root@scientific ~]# brctl show
bridge name      bridge id                STP enabled
```

| interfaces |                   |    |      |
|------------|-------------------|----|------|
| br0        | 8000.4ea7e4cf4633 | no | eth0 |
| br06499    | 8000.000000000000 | no | tap0 |

## 启动KVM

指定网络参数 **-net nic -net tap,ifname=tap0,script=no**

```
/usr/libexec/qemu-kvm -hda disk.img -m 8000 -net nic -net
tap,ifname=tap0,script=no -vnc :1

/usr/libexec/qemu-kvm -hda disk.img -m 8000 -net nic -net
tap,ifname=tap0,script=no -nographic -daemonize
```

## virt-install

```
yum install -y libvirt python-virtinst virt-manager
```

## 命令行安装

```
sudo virt-install --connect qemu:///system -n Ubuntu32 -r 512 -
-vcpus=1 -f /dev/sda3 -s 9 -c Desktop/ubuntu-10.10-desktop-
i386.iso --vnc --noautoconsole --os-type linux --os-variant
generic26 --accelerate --network=bridge:virbr0 --hvm
sudo virt-install --connect qemu:///system -n Ubuntu32 -r 512 -
-vcpus=1 -f ~/ubuntu32.qcow2 -s 12 -c esktop/ubuntu-10.10-
desktop-i386.iso --vnc --noautoconsole --os-type linux --os-
variant generic26 --accelerate --network=bridge:br0 --hvm
```

## 进入GUI工具

```
virsh -c qemu:///system list
```

```
sudo virt-manager
```

## 1.2. Ubuntu

确认你的CPU是否支持KVM

```
egrep '(vmx|svm)' -color=always /proc/cpuinfo
```

```
sudo apt-get install kvm libvirt-bin ubuntu-vm-builder bridge-  
utils kvm-pxeuml-utilities
```

kvm gui

```
sudo apt-get install ubuntu-virt-server ubuntu-virt-mgmt  
ubuntu-vm-builder python-vm-builder kvm-pxe
```

## 1.3. CentOS 6.2

```
# yum groupinstall Virtualization  
# yum groupinstall "Virtualization Client"  
# yum groupinstall "Virtualization Platform"  
  
# /etc/init.d/libvirtd start  
Starting libvirtd daemon: [  
OK ]
```

## 1.4. Scientific Linux Virtualization

```
[root@scientific ~]# yum groupinstall 'Virtualization'  
'Virtualization Client' 'Virtualization Platform'  
'Virtualization Tools'
```

# 1.5. libvirt

## virsh

```
$ sudo virsh -c qemu:///system list
Id Name                               State
```

|       |               |         |
|-------|---------------|---------|
| ----- |               |         |
| 1     | Ubuntu        | running |
| 2     | Ubuntu-Server | running |

```
# virsh list
Id      Name                               State
-----
```

|   |           |         |
|---|-----------|---------|
| 1 | Ubuntu    | running |
| 2 | CentOS6.4 | running |

```
# virsh

显示虚拟机列表：
virsh # list --all

启动虚拟机：
virsh # start [name]

关闭虚拟机：
virsh # shutdown [name]

重启虚拟机：
virsh # reboot [name]

指定虚拟机开机自动启动：
virsh # autostart [name]
```

### 例 3.1. virsh

```
virsh # list --all
Id      Name                               State
-----
```

```

-      CentOS6.4                shut off
-      FreeBSD                  shut off
-      Test                     shut off
-      Ubuntu                   shut off
-      www                      shut off

virsh # start Ubuntu
Domain Ubuntu started

virsh # list --all
  Id      Name                      State
-----
  1       Ubuntu                    running
  -       CentOS6.4                 shut off
  -       FreeBSD                   shut off
  -       Test                      shut off
  -       www                       shut off

virsh # quit

```

## console

```

# virsh list
  Id      Name                      State
-----
  2       monitor                    running

# virsh console monitor
Connected to domain monitor
Escape character is ^]

```

Ctrl + ] 推出 console

## dumpxml

dump 虚拟机配置文件

```
virsh dumpxml Test
```

## Virtual Machine Manager

### 1.6. FAQ

#### No hypervisor options were found for this connection

Error: No hypervisor options were found for this connection

```
[root@r910 etc]# grep kvm /var/log/messages
Jun 21 15:28:05 r910 udevd[803]: specified group 'kvm' unknown
Jun 21 15:28:05 r910 udevd[803]: specified group 'kvm' unknown
Jun 21 15:28:07 r910 kernel: kvm: disabled by bios

sizeof(vma)=200 bytes
Switching to clocksource kvm-clock
```

## 2. Xen

### 2.1. install

```
[root@development ~]# xm list
```

| Name     | ID      | Mem(MiB) | VCPUs |
|----------|---------|----------|-------|
| State    | Time(s) |          |       |
| Domain-0 | 0       | 1735     | 2 r-- |
| ---      | 1194.1  |          |       |

create a virtual harddisk

```
[root@development ~]# mkdir /srv/vm/
[root@development ~]# dd if=/dev/zero of=/srv/vm/centos.img
bs=1M count=4096
4096+0 records in
4096+0 records out
4294967296 bytes (4.3 GB) copied, 49.2547 seconds, 87.2 MB/s
```

ubuntu

```
[root@development ~]# virt-install -n centos -r 256 -f
/srv/vm/centos.img --nographics -l ftp://192.168.3.9/pub/
```

### 2.2. Manager

list

```
[root@development ~]# xm list
```

| Name     | ID      | Mem(MiB) | VCPUs |
|----------|---------|----------|-------|
| State    | Time(s) |          |       |
| Domain-0 | 0       | 1726     | 2 r-- |
| ---      | 5686.6  |          |       |

```
centos                                     6       127       1 -b-

Automatically starting domains

```
[root@development ~]# mv /etc/xen/centos /etc/xen/auto
```

## 3. OpenVZ

### 3.1. 安装OpenVZ

过程 3.1. OpenVZ 安装步骤

#### 1. 获得OpenVZ yum安装源

```
# cd /etc/yum.repos.d
# wget http://download.openvz.org/openvz.repo
# rpm --import http://download.openvz.org/RPM-GPG-Key-OpenVZ
```

#### 2. 安装OpenVZ核心以及头文件

```
# yum install ovzkernel[-flavor]
```

#### 3. 修改启动所使用的内核为OpenVZ内核，使OpenVZ内核为默认启动内核

```
# vim /etc/grub.conf
```

将类似下面的内容

```
title Fedora Core (2.6.8-022stab029.1)
    root (hd0,0)
    kernel /vmlinuz-2.6.8-022stab029.1 ro root=/dev/sda5
quiet rhgb vga=0x31B
    initrd /initrd-2.6.8-022stab029.1.img
```

修改为类似这样

```
title OpenVZ (2.6.8-022stab029.1)
    root (hd0,0)
    kernel /vmlinuz-2.6.8-022stab029.1 ro
root=/dev/sda5
    initrd /initrd-2.6.8-022stab029.1.img
```

或直接在里面寻找类似开头为

```
title CentOS (2.6.18-194.3.1.el5.028stab069.6)
```

的项目，并且把default改为他的下标，下标从0开始

#### 4. 修改Linux网络配置文件

```
/etc/sysctl.conf
# On Hardware Node we generally need
# packet forwarding enabled and proxy arp disabled
net.ipv4.ip_forward = 1 #修改

net.ipv6.conf.default.forwarding = 1 #添加
net.ipv6.conf.all.forwarding = 1 #添加
net.ipv4.conf.default.proxy_arp = 0 #添加

# Enables source route verification
net.ipv4.conf.all.rp_filter = 1 #修改

# Enables the magic-sysrq key
kernel.sysrq = 1 #修改

# We do not want all our interfaces to send redirects
net.ipv4.conf.default.send_redirects = 1 #添加
net.ipv4.conf.all.send_redirects = 0 #添加
```

#### 5. 关闭SELinux

```
# lokkit --selinux=disabled
```

```
SELINUX=disabled
```

## 6. 重启Linux

```
# reboot
```

## 7. 安装OpenVZ管理工具

```
# yum install vzctl  
# yum install vzquota  
# yum install vzyum
```

用到什么工具就安装什么工具，具体可以使用# yum search vz\*搜索一下

## 8. 启动OpenVZ服务

```
# /sbin/service vz start
```

## 3.2. 使用OpenVZ & 建立VPS

由于VZ是半虚拟化的，所以VZ和VM不同的是VZ需要系统模板，而不是VM那样只需要一个ISO文件就可以安装

### 安装操作系统模板

#### 1. 搜索系统模板

```
# yum search vztmpl
```

## 2. 在搜索出来的结果中选用你想安装的操作系统

```
# yum install vztmpl-centos-4 -y
```

## 3. 为操作系统模板建立缓存

在我装的最小化CENTOS中，此步要下载很多包，需要很长时间完成

```
# vzpkgcache
```

该命令将建立centos-4-i386-minimal.tar.gz和centos-4-i386-default.tar.gz文件 或

```
# vzpkgcache centos-4-i386-minimal
```

建立 centos-4-i386-minimal.tar.gz

```
# vzpkgcache centos-4-i386-default
```

建立 centos-4-i386-default.tar.gz

出现Cache file centos-4-i386-default.tar.gz [120M] created.表示创建成功

**注意：本次步骤可能会出现如下错误**

```
cp: cannot stat `/etc/sysconfig/vz-scripts//ve-
```

```
vps.basic.conf-sample': No such file or directory  
ERROR: Can't copy VPS config
```

解决方法：进入/etc/sysconfig/vz-scripts/目录，将ve.basic.conf-sample 拷贝一份重命名为ve-vps.basic.conf-sample

查看系统中已经存在的操作系统缓存

```
# vzpkgls
```

## 创建OpenVZ操作系统节点（VPS）

### 1. 准备配置文件

平分主机系统资源（当然，如果你对配置文件的修改很熟悉也可以自己定制）

```
cd /etc/sysconfig/vz-scripts/  
vzsplitt -n 3 -f vps.zenw.org
```

这样，系统资源就被平均分成了3分，并且产生了一个配置文件示例

### 2. 验证配置文件有效性

```
vzcfgvalidate ve-vps.zenw.org.conf-sample
```

### 3. 创建VPS节点

```
vzctl create 100 --ostemplate centos-4-i386-minimal --  
config vps.zenw.org
```

其中100是该节点的编号，可以自己定义

#### 4. 配置该VPS

```
设置VPS的hostname
vzctl set 100 --hostname zenw.org --save
设置VPS的ip
vzctl set 100 --ipadd 192.168.xxx.xxx --save
设置VPS的管理员帐号和密码
vzctl set 100 --userpasswd root:xxxxxxxxx
设置VPS的DNS服务器
vzctl set 100 --nameserver 8.8.8.8 --save
设置VPS自启动
vzctl set 100 --onboot yes --save
启动VPS节点
vzctl start 100
执行VPS内部的命令（这里是开启VPS的ssh服务）
vzctl exec 100 service sshd start
加入VPS节点
vzctl enter 100
停止VPS节点
vzctl stop 100
```

### 3.3. 设置VPS参数

#### 1. 修改VPS节点的配置文件

```
vim /etc/sysconfig/vz-scripts/100.conf
在文件中添加或修改 DISK_QUOTA=no

重启VPS节点
vzctl restart 100
查看当前磁盘大小
vzctl exec 100 df
设置磁盘大小
vzctl set 100 --diskinodes 75000000:79000000 --save
vzctl set 100 --quotatime 600 --save
查看修改后的磁盘大小
vzctl exec 100 df
vzctl exec 100 stat -f /
```

```
vzctl set 100 --quotauidlimit 100 --save  
vzctl restart 100  
  
vzctl exec 100 rpm -q quota  
  
vzyum 100 install quota  
  
vzquota stat 100 -t
```

## 2. 为VPS节点安装yum工具或其他工具

```
vzyum 100 install <软件名称>  
vzyum 100 install yum
```

另外,如果vzctl enter进入节点时出现错误,或无法ssh节点,需要运行以下命令: vzctl exec 112 "cd /dev; /sbin/MAKEDEV pty; /sbin/MAKEDEV tty; /sbin/MAKEDEV generic"

## 4. vagrant - Tool for building and distributing virtualized development environments

<https://www.vagrantup.com/downloads.html>

### 4.1. vagrant for windows

下一步

下一步

下一步

安装

下一步

完成

重启

## **5. 虚拟机管理**

**5.1. Proxmox - Open-source virtualization management platform Proxmox VE**

**5.2. OpenStack**

**5.3. CloudStack**

**5.4. OpenNode**

**5.5. OpenNEbula**
